HOW I MADE MOTOR CYCLING A REAL PLEASURE?

(By J. M. Randell.)

Seeing the recent article, "Do you find Motor Cycling a Real Pleasure?" I feel that I must write and say how I made motoring a pleasure. I might say that I started motoring late in 1906 with a $3\frac{1}{2}$ h.p. Minerva. I soon learnt the manipulation of the machine, and also learnt that excessively hard work it was to get started. Not being an athlete I did not care to risk jumping on after the machine was moving. I had almost decided to abandon motoring when the thought struck me that it might be possible to get a device fitted to enable the engine to be started previous to mounting like a car is. I began to make enquiries and found that there were several devices on the market. I therefore sent for lists, and finally chose an Osborne patent free engine pulley. Before three days were up I had ordered and received the pulley. It took my mechanic about half an hour to fit this. I can tell you I was anxious to get the engine started with the handle. I adjusted the throttle and spark, switched on, and gave one turn of the handle supplied with the pulley, and the engine fired merrily. I am sure that the engine starts much quicker when there is no load on, as the first explosion sends it round.

I rode this machine for about twelve months without the pulley giving one moment's bother. I always started with the handle and got across the saddle, then pulled the lever inwards, and the machine sailed away. It was a perfect pleasure to feel the machine glide along even on a hill. My wife began to get jealous at me going out so much leaving her alone, so got me to invest in a sidecar. Well, we rode with the car for some time, but there were several hills that we could not get up. Now, having ridden a bicycle with a three-speed gear, I thought that such an arrangement would be useful to me on hills.

I made enquiries, and found that there were several devices on the market, but these were for both chain and belt drives, but I much preferred the belt drive, as I did not wish to alter the engine-shaft, etc. Moreover, all the devices only gave two-speeds. Now I knew the disadvantage of two-speed gears from my experience with a pedal cycle. I was wondering what to do when I heard that Messrs. Osborne Bros., Princess Works, Lincoln, could supply me with a four-speed pulley. I wrote to them for list, and received a handsome booklet describing the pulley. This I at once saw incorporated a free engine like my own. I at once placed an order with them. The gear cost me £7 10s. After a wait of four days the same came to hand. It was handsomely finished, and looked quite businesslike. I got this fitted easily; it took about three hours. I was even more anxious to test the new device than the old

one. After all was ready I got my wife in the car, started the engine with the neat handle supplied, pressed the side lever forward, and—well, the machine and car glided forward in a most wonderful way in spite of it being a fairly steep hill. I soon raised the gear and got into the top speed, when the machine flew along. What a change there was in the machine. Hills we used to push up before now were like the level. It was quite fascinating to be able to raise or lower the gear just as I advance or retard the spark. Well, we came to some thick traffic. I could simply drive the machine behind the slowest moke. Coming to a crossing we had to stop the machine (not the engine). A wait of a couple of minutes, and off we went again with simply opening the throttle and pressing the lever forward.

Well, for pleasure I can honestly say I never knew what motoring actually was until then. My friends were rather jealous of me, but they got over that by fitting a four-speed pulley themselves. By this time the price had come down to £5—quite a nominal figure. I at once knew that this gear would soon be quite popular. So it was in my district. While visiting Lincoln a few days ago I called at the works, and the manager, R. S. Osborne, kindly showed me over. There seemed to be a great amount of business going on. Four motor cycles were being fitted with the gears.

I was surprised to see the number of machines set apart for the manufacture of these pulleys. I went through the machine shop, fitting shop, mounting shop, and plating shop (this department was very interesting to me, not having seen anything of the sort before). They do copper, brass, nickel plating, etc.

My time in the works was now expired, and I departed after my enjoyable visit. There was one thing that I noticed. That was the telephones in each department so as to facilitate handling urgent business with little work. As I was departing the postman came with a bunch of letters, which I was informed were mostly orders for the holidays. Then came several telegrams—some urging delivery, others money orders.

To conclude with, I should certainly advise everyone who finds motoring not a thorough pleasure to have one of the four-speed pulleys fitted at once. They cost £5 now if obtained direct from the makers, Messrs. Osborne Bros., Princess Works, Lincoln.

EVERYTHING FOR THE MOTOR CYCLIST

POWELL & HANMER'S MOTOR CYCLE LAMP.

With hood and bracket (plated only).

Burning capacity about four hours.
Height 8½ in. Front 5 in.
Weight 3½ lbs.
Price 17s. 6d. Carriage 6d.

THE 'HELLESEN' DRY BATTERY.

6½ in. high × 4½ in. × 2½ in.

Clean and free from acid.
Price 6s. 6d. Tricar size 9s. 6d.

MOTOR CYCLISTS' MIRROR.

Enables the rider to see what's behind him, and, what's more important, the police trap.

Fitted on handle-bar.

Made on ball joint so that it can be adjusted to any angle.

Size of glass, 4½ in.

Adjustable in height from 13 in. to 18 in.

Price 6s. 9d. Carriage 6d.

FULLER'S NON-TREMBLER COIL.

Size 2½ in. × 3 in.
× 4½ in.

Price 10s. 6d.

IN OPEN COMPETITION.

May 2nd, In the M.C.C. Hill
at Sharpnho, the "BROWN"
p. Single Cylinder Motor Bloyole
FASTEST TIME in the Single
der Class, WON the Single
der Handicap, and did FASTEST
OF THE DAY with the excep-
of one twin cylinder which
only two-fifths of a second
It, however, beat THIRTEEN
CYLINDER MACHINES.

the "BROWN" secured
THREE FIRSTS
AND TWO SECONDS
OUT OF
FIVE EVENTS
Essex M.C. Open Hill Climb,
High Beech, May 16th.

Auto-Cycle Union Hill Climb.
tton Bank (May 30, 1908).
the "BROWN" 3½ h.p. won
competition for Motor Bi-
es with engines not exceed-
82 m m bore, being 31½ secs.
er than the machine that
hed second. The "BROWN"
secured second place in the
s for engines not exceeding
m m bore.

What more convincing proof of the sterling qualities of "BROWN"
Motor Bicycles could be given than the recent performances at
Sharpnho and High Beech and the letter from Mr. Stewart of
Poona. It is not at all surprising to us that the "BROWN" gives
such great satisfaction to riders, and such a good account of itself
in Open competition—it is the way the engine is made and the way
in which the whole machine has been designed and constructed.

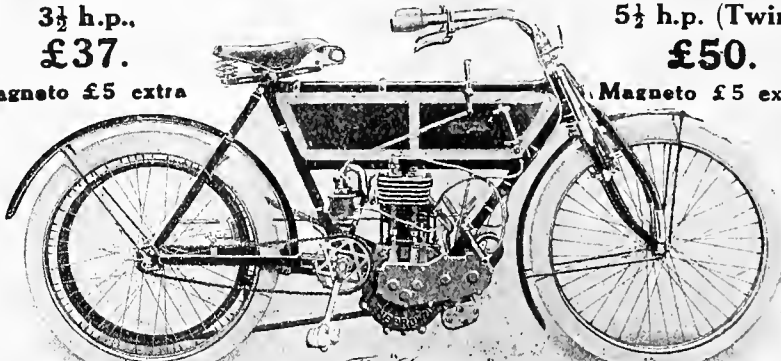

The Brown

Every "BROWN" Motor Bicycle is thoroughly tested on the
road before being despatched, and each machine must come up
to the high standard of perfection which has made it so
popular all over the world. May we send you a copy of the
latest "Book of the BROWN," which gives full particulars.

Magnet £5 extra.

The Brown

NONE TO EQUAL THE "BROWN."

Poona, 30th April, 1908.

I thought I would give my
"BROWN" Twin Cylinder Motor
Cycle, which was purchased over a
year ago, a really good test before
rushing off to tell you how com-
pletely it has come up to my satis-
faction.

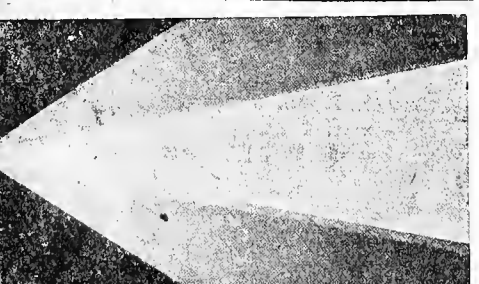

I will not say I have run the
whole time without "touching a
spanner," as I am too old a
Motorist and have ridden too many
machines to express my enthusiasm
in that way.

Once you get into the "BROWN'S"
way of running, I will emphasise the
fact, very loudly, that you can say
you have found your ideal mount.
The rhythm of each cylinder makes
Motor Cycling fascinating, and there
is none of the "ennui" experienced
on a machine which is continually
shedding its nuts or requires adjusting
every time you take her out.

There has only been one Motor
Cycle Trial in India since I have
owned her, and she did remarkably
well, being the only machine out of
thirteen others to finish on the
second day. The roads were too
dangerous then to proceed with the
run.

I have yet to come across a mount
to equal it in speed, and yet be used
as delightfully for touring.

PATRICK A. STEWART

"Autoclipse"

REGISTERED TRADE MARK

MOTOR CYCLE LAMPS,

which, in addition to their great light-giving
powers, are guaranteed to stand the vibra-
tion of a motor bicycle on the roughest roads.

"AUTOCLIPSE" Motor
Cycle Lamps are very strong-
ly made, and are guaranteed
to stand the severe vibration
they are subjected to on
motor bicycles. The Motor
Cycle model has a double back,
and the Bracket is riveted
on, thus making it impossible
for the back of lamp to come
away, as in the case of most
other lamps which are made
with single back. Mr. W. H.
Wells, the well-known motor
cyclist, says: "Although near-
sighted, I can see the road
perfectly 100 yards ahead."
If you are anxious to secure
immunity from accident when
riding at night, it is absolute-
ly imperative that your cycle
should be fitted with an
"AUTOCLIPSE" Lamp.
Let us send you the "AUTO-
CLIPSE" Catalogue, which
gives all particulars.

MORE POWER ON HILLS.

PROOF.

Empire, Glasgow,
May 4th, 1908.

The Bosch Magneto Co., Ltd.

Dear Sirs,—Will you kindly forward your booklet on "The Care of the Magneto."

I am using a 1908 single-cylinder REX-DE LUXE motor cycle, with your latest type of magneto machine, and as I am practically ignorant as to the management of a magneto, I should be pleased to have the book.

By the way, I am only asking for the book out of curiosity, as this is my third machine fitted with your magneto, and up to now I have never had to look inside, or to experiment, or to do the hundred and one little things I read about which other riders seem to have. Anything in the way of more reliable high-tension ignition for motors than the BOSCH is, in my opinion at least, impossible to be found. Since using the Bosch, I have forgotten that there is such a thing as ignition.

Thanking you in anticipation, and also for many a pleasant ride since discarding coils and accumulators.

I remain,

Yours faithfully,

JACK LANE.

Does that interest you?

Write for further particulars.

THE ... BOSCH SPARKING PLUG—

has *Four* distinct points of firing. It never soots, never misfires, and is always a "fat" hot spark.

Price **3/6** each.

VINDEC SPECIAL

THE MOTOR CYCLE OF MERIT.

POPULARITY.

This results from well ascertained causes. The best of everything regardless of cost enters into the construction of the "Vindec Special." Not alone has the efficiency of the engine, the stability of the frame, and the design and finish of each component part been carefully studied, but due regard to the comfort of the rider has been considered by the adoption of the Truffault Suspension Fork (which practically eliminates all vibration), the accessibility of all levers; simplicity of control; ample brake power; substantial footrests; hinged rear mudguard giving ready access to the tyre in case of puncture, and tubular stand, attached independent of the rear axle. These are but a few of the reasons for "Vindec Special" popularity, but, considered from **the private owner's standpoint**, the fact that nearly 75 per cent. of successes in open competitions during the Season 1907 were secured by private owners in competition with trade riders, it will be evident that the "Vindec Special" does not depend upon the professional rider to prove its speed, ease of control, and absolute reliability.

FULLY ILLUSTRATED BOOKLET SENT FREE UPON REQUEST.

SOUTH BRITISH TRADING CO LTD

13 & 15 WILSON ST, FINSBURY. LONDON.E.C.

ONE MORE OPPORTUNITY!

Owing to the tremendous success of their "Special Exchange Offer" in March, and the numerous requests since made for a repetition of the same, the Directors of Zenith Motors, Ltd., wishing to have one of the well-known "Zenith Bicar" running in **every** District in the Kingdom, are prepared to depart from their usual policy of refusing (all) business on exchange principles, and will make a reasonable allowance on a limited number of second-hand machines (of any make) belonging to prospective customers in districts where there is not at present one of the now world-famous "Zenith Bicar."

The "Zenith Bicar" Patent Twin-frame Spring-suspension System of Construction defies Road Shocks. "No front forks" is only one of its many pioneer points. No trouble, no vibration, no risk of slide-slip, no running alongside to mount—it starts with a handle, same way as a car. Comfortable footboards instead of pedals. Open frame and low build.

EASE and LUXURY.

Fitted with Fafnir $3\frac{1}{2}$ h.p. air-cooled engine, 80 mm. x 80 mm., Longue mare carburetter, free engine clutch, starting-handle, Prested high-speed trembler, two accumulators, exhaust valve lifter (operated from handle-bar), Clincher tyres (24 in.), Whittle's or Watawata belt, Brooks' saddle of the finest workmanship through; out; 43 guineas net cash. Two-speed gear or magneto ignition, 50 guineas

"MOTOR CYCLES FOR SALE" seldom includes the "Zenith Bicar," despite its years of existence and widespread output. Unlike the many hundreds advertising their anxiety to part with other makes, "Zenith Bicar" riders "grapple them to their souls with hooks of steel"

OUR OFFER IS STRICTLY LIMITED TO FIFTY MACHINES ONLY.

When replying please send full particulars of your machine, date, condition, and lowest price you will accept, stating which model Zenith Bicar (standard, two-speed, magneto, or two-speed and magneto, 57 guineas) you wish.

ZENITH MOTORS, LTD., 101a, Stroud Green Road, LONDON. Nearest Station—**FINSBURY PARK.**

The "Zenith" Tricar, spring frame, built on same principle as "Zenith Bicar," with 6 h.p. twin-cylinder J.A.P. engine, two-speed gear and starting-handle, 72 guineas net. Marvellous value.

Agent for New Zealand—Mr. P. Genn, Christchurch, N.Z. Straits Settlements—Messrs. Hoot & Co., Ipoh, F.M.S. The "Bicar" is also running in S. Africa, India, Australia, Siam, Java, Hong Kong, Mexico, Brazil, and many other countries where the roads are of the very roughest description. Write for a catalogue, and see the enthusiastic testimonials respecting this unique machine.

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

JAP Patent Carburetter.

As the result of experiments extending over several years, this Carburetter was devised nearly two years ago. We have had a number in constant use on various engines for the past 18 months. The advantages of this Carburetter are:

Simplicity.

Automatic action, needing no hand regulation.

Easier starting (with throttle almost closed). Engine starts smoothly and slowly without jump or jerk.

Slower, quieter, and more flexible running of engine.

Greater speed and power with less petrol consumption.

Simpler and easier control.

Increases the pleasure of driving twofold.

Order at once to ensure prompt delivery.

Jap Patent Variable Pulley.

A Comprehensive Range

The range of N.S.U. models covers all the requirements of motor cyclists. It extends from the $1\frac{1}{4}$ h.p. lightweight to the 6 h.p. twin. The popularity of the N.S.U. is seen in every hill-climbing contest, in every reliability trial, and wherever motor cyclists congregate. If your choice rests on a N.S.U. you will have made the same decision as 12,000 other satisfied motor cyclists. Write us or talk to your agent.

14, Conan Mansions,
W. Kensington.

Dear Sirs,

I think it is my duty to let you know what I think of the "Watawata" Belt. I specified "Watawata" Belt with my new 1908 Triumph last December and have used it daily since the beginning of January, riding at Lippetts Hill (limb), Sutton Bank, and then in the London-Edinburgh Run, and I have not had the slightest trouble with it. It is really a record, I think, and I intend using the original belt in the End-to-End Ride next July. I shall carry a spare, but no doubt will not require same. You are at liberty to use this for advertising purposes if you so desire.

Yours sincerely, GORDON GIBSON.

ALL THE WORLD

is talking of the ROC—"the car on two wheels." No machine has more rapidly come into the very front rank. The Roc live axle with clutch and speed gear is the key to the future of motor cycling. The 1908 season has shown that the system is as efficient in practice as it showed itself to be in theory.

The 1908 Roc is also conspicuous by its workmanlike details; the ball-bearing engine, the low duplex frame, the new large silencer, the remarkable control, are other Roc points. The Roc 4 h.p. Royal Military Model, inclusive of these features, sells at **48 gns.** Early deliveries can now be given; also of the Roc conversion sets, adaptable to every make of belt-driven machine, at **10 gns.**

WONDERFUL
LITTLE
MACHINE
IS
THE

MOTOSACOCHE.

SHREWSBURY HOUSE, NORFOLK ROAD, SHEFFIELD.

June 10th, 1908.

H. AND A. DUFAUX.

Gentlemen,—In enclosing a Postal Order, I should like to say that I'm still perfectly satisfied with your wonderful little machine. After 2,068 miles, including journeys into every corner of the Peak, the only mechanical trouble has been the fraying of a low tension wire at the contact breaker; put to rights in a few minutes. Yesterday I went from Sheffield to Buxton without a hitch or hill-stop of any description.

Yours sincerely, (Signed) J. W. MANTON.

MICHELIN

Motor Cycle Tyres

are the most economical not only on account of their low price but because you can get twice the amount of wear out of them. Try one against a tyre of any other make.

FOR YOUR SELECTION.

SINGLE, TWINS, and FOUR-CYLINDER MODELS, LIGHTWEIGHT TWO-SPEED MACHINES, and SIDECARS.

— NOW ON VIEW. —

We have carefully studied the wants of motor cyclists, and are in a position to supply any make of machine, and always have a good selection on show.

Not only can we do this, but we will take your old bicycle in part exchange, buy it outright, or sell it on commission, on the understanding that no sale no commission.

Send us particulars of the machine you require, and let us have your old machine for valuation.

Phelon and Moore Two-speed Magneto. No pedals required. Gold Medal London to Edinburgh this year. £52 10s.

DERMATINE BELTS
HOLD ALL RECORDS.

End-to-End Record, June 9th and 10th :
Mr. A. W. Bentley, using Dermatine belt.

M.C.C. 24 Hours' Ride to Edinburgh,
June 5th and 6th :

35 were successful, using Dermatine belts.

Stadium Race Meeting, June 8th :

Harry Martin, First in Ten Miles Race.

Stadium Race Meeting, June 24th :

again the first, second, and third winners were fitted with Dermatine belts.

No other belt holds such records. The Original Rubber and Canvas Belt. **BEWARE OF IMITATIONS.** The standard belt that is adopted by all leading manufacturers.

End-to-End Record.

Read the testimonial from the Triumph Co.
Coventry, June 22nd, 1908.

Mr. Stanley J. Webb, 42, London Road,
Bromley, Kent.

Dear Sir,—I do not know whether we have written to you about the Bentley End-to-End record. Mr. Bentley had a Stanley Dermatine Belt fitted to his motor cycle. It gave him entire satisfaction, and had not to be touched once during the whole ride of 886 miles.

Yours faithfully, M. J. SCHULTE,
Managing Director, Triumph Motor Co., Ltd.

Second season in use, and still going strong,
125, Bunhill Row, E.C., 12/6/08.

Dear Sir,—You will be pleased to hear that the "Dermatine" Belt I used in this year's London-Edinburgh run gave me no trouble whatever, and that, moreover, it was the identical belt I used in last year's L.-E. run. It is still going strong, though having run nearly 3,000 miles. Yours faithfully, J. P. LE GRAND.

800 miles, and no trouble nor once
shortened.

Southernhay, Loughton, June 12th, 1908.

Dear Sir,—I must again congratulate you upon your excellent belts, as the one I used on my 3½ Vindec in the Schulte Cup Competition to Edinboro' and back gave me no trouble whatever, and was not even shortened once in 800 miles. I consider this a severe test, and a splendid proof of efficiency.

Yours faithfully, OWEN L. SUMMERS.

MOTOR RUNS FASTER.

40, Jubilee Road, Doncaster, May 12th, 1908.
Dear Sir,—I am very pleased to inform you that the sample Centipede 3in. belt you sent me gives every satisfaction. It is the best belt I ever used, and I'm no chicken in motor matters. It "grips" and is beautifully clean, practically free from stretch, very flexible, and my machine runs faster with it than ever before. Trusting you may have the success you deserve,
Yours faithfully, J. H. Wilkinson

Price of Belt per foot:
¾ 1/6, ¾ 1/9, ¾ 2/3, 1 2/3, 1 2/6.
Special terms if desired—half the amount with order and the balance in three months if satisfactory.

POLLIN, BELT MAKER, SPALDING.

March 16th, 1908.

Dear Sirs,

Thanks for cheque to cover for motor bicycle sold so promptly through my advt. in "The Motor Cycle."

You may like to know that although I paid for two insertions of my advt., the motor was sold before the second advt. appeared, and I therefore consider that the sale is especially speedy.

If you care to use this information, you are at liberty to do so.

Yours truly,

L. J. CALLCOTT.

**One Advt.
only needed.**

THOSE HILLS YOU PEDAL.

Read this extract from testimonial.

Before I had the gear I had frequently to use pedals to assist engine up steep pitches, but since purchasing the gear from you, I have never on the road had to use the pedals and can easily get up any hill round here including Clayton and Hand Cross with passenger on board. H. ASHLEY GAITSKELL, M.D.

THE BURGESS ENGINEERING Co., Oxford Road, Clarendon Park, LEICESTER. Tele: 4251.

All 1/- each,

S. T. ROBSON,
7, Blake Lane, Birmingham.

MISCELLANEOUS.

DON'T write to "The Motor Cycle" to worry them with tips before you have tried Motiphos. Motiphos has proved a cure for overheating troubles, loss of power, loss of speed, slipping belts, slipping and fierce clutches, slipping and inactive brakes—in fact, most of these troubles can be traced to inefficiency of drive through the leather parts, because the leather wants feeding and bolstering up. Motiphos will do this. Any dealer can supply you a tube, or, if difficulty, send P.O. 18. direct.—The Motiphos Co., 34, New Bridge Street, London, E.C.

TRADE ADVERTISEMENTS.

TUNING UP FOR THE END-TO-END.

By B. H. DAVIES.

I HAVE been intending for some while to write a few notes about preparing 1906 and 1907 machines for the End-to-end, as there are certain to be a number of would-be entrants who cannot run to a brand new mount, and there is no doubt these riders will have an excellent chance of a gold medal, since knowledge of one's mount is at the very least quite as important as the inherent excellence of the mount itself. In 1906 an amateur on a brand new Triumph fresh from the works rode through *unofficially* without a single adjustment; that is to say, with less anxiety than Hulbert, Bramley-Moore, Cooper, or myself, since he did not even experience a puncture; but this was a gorgeous fluke, and taking the percentage of luck, a sound knowledge of an old machine is a better asset in these trials than a start on a comparatively unknown machine specially tuned by the makers. Now I often meet with amateur owners whose machines have lost that pristine "zip" with which they once used to hum along the roads, and have joined the army of plod-along-somehow, uncertain uphill sort of beasties, and I want now, if I can, to aid these gentlemen to get their machines so fit that they can compete in the great run of the year with a good confidence.

Two things are capable of wrecking any entrant's prospects. One is any serious derangement, capable of necessitating a prolonged delay in any section; the other is the want of full power, or the loss of full power. On a schedule run this last is of prime importance. A rider might reach Moffat without a single stoppage of any sort or kind, but the power might have faded away so that after a twenty minutes' tyre stop on a

short section he could not raise the speed required to save his marks. This mischance would be followed by pushing part of the way up two or three hills with more losses of marks, and although his machine has proved itself perfectly reliable from a non-stop point of view, his award would only be at the best a silver medal. We must guard against both the long stoppage and the gradual decay of engine efficiency.

The long stoppage is conceivable even if the good old crock has already behaved excellently for 5,000 miles or more. I append precautions:

1. TYRES.—*New tyres are absolutely essential.* New tyres—especially of a different make—have a habit of not fitting accurately, in which case they are either very hard to get on and off when a puncture comes, or else they leave a gap between the beads, and nip the tube sooner or later. Therefore, the wise entrant will fit his new pair of tyres at home, make absolutely certain they are a sound fit, and knead them by two or three detachments if necessary, until they slip on and off like a glove. He will then replace the old ones, ride down to Penzance, arrive in good time, and fit the new ones there for the start of the run, further safeguarding himself by carrying two or three detachable tubes—these last are *essential*, since punctures have a way of occurring in the shorter controls, where without detachable tubes heavy loss of marks is *inevitable*.

2. ENGINE.—No matter how good the apparent condition of the valves, they should all be replaced by new ones, since some metal parts show no sign of failure till a very few miles before failure comes. The

OCCASIONAL COMMENTS.

By "IXION."

Belt Fasteners.

Mr. W. H. Berisford, the patentee of Brooks Stratex belts, reminds me that his belt resembles the Watauta, in the ideal feature of requiring no fastener at all. Unfortunately, rubber belts, which were naturally included in my general remarks, cannot be designed as endless; one wishes they could. It would be interesting to know if Mr. Berisford has ever experimented with a belt composed of his Stratex principle out of little strips with a canvas basis and rubber covered. If this would work we should have an endless rubber belt. I have received several sample fasteners from different patentees, and, while several of them show great ingenuity, nearly all of them are fitted with wretched apologies for screw threads, both as regards the bolts and the bolt holes.

The End-to-end.

I should like to add my congratulations to the chorus now besieging Mr. A. W. Bentley, and couple with them my commiserations on the failure of his ending arrangements. This was particularly hard on him, as one or two other riders intend making strenuous efforts to win the record from him, and the three hours or so he undoubtedly lost through these errors would have made his record almost unassailable except with the best of luck. Riders who know the route and have held or attempted the record assert that, given the best of luck with the weather and machines and tyres, the ultimate record should fall as low as thirty-five hours or thereabouts; and if Mr. Bentley had set the figures at thirty-eight hours, as he narrowly failed to do, the record would have stood to his credit for a far longer time than is at present likely.

Footrests Fouling Ground.

The Sutton Bank climb revealed the fact that while a road, low footrests serve admirably as rests for the machine when stationary, they add a grave danger to taking sharp corners at speed. I wish makers would realise how seriously this applies to pedalling gear on the modern low framed machine. I do not know a standard 1908 model which I can safely drive up a certain twisty hill near my home unless I first make sure that the near side pedal crank is either horizontal or vertical above the bottom bracket, and neglect to do that this pedal is in the correct position has nearly brought me down on several occasions, and has cost me a couple of broken cranks. The time is surely near when pedalling gear may be dispensed with on first-class powerful modern machines, on which it is seldom of the least use, and often in the way. And when long footrests are fitted they should be set higher up on the machine.

A Good Gear.

I just lately examined a Phelon and Moore gear which was fitted to a powerful twin in 1906, and has been running on it with and without a sidecar ever since. During this period the makers have never once seen the gear, and it has never given trouble. Considering the lightness of the chains and sprockets, this record speaks volumes for the workmanship of the gear as a whole, and especially for the delicacy and efficiency of the bronze rings and steel wedges which form its clutch system. Similar chains were fitted last summer to a light tricar under my notice, but in combination with a leather cone clutch and dog clutch gear, and under these conditions, working with a similar load and engine, the chains gave such an infinity of trouble that they had to be scrapped, sprockets and all, and chains of heavier make substituted. I wonder whether any other gear can show a record of two non-stop seasons with a twin engine and sidecar? The gear in question is now as good as new.

Abnormal Engine Conditions.

Mr. Earle L. Ovington's description of the behaviour of his big four F.N. interested me, particularly because I have once or twice experienced something very closely resembling it when running a single-cylinder engine on paraffin. Everyone who uses a machine for running about towns on everyday business knows that a habit of carelessness about the amount of petrol in the tank is apt to develop, and so it is not an infrequent experience for me to run out of petrol. Under these circumstances I have often been able to fill up with paraffin before the engine got cold, warm it up well on the stand, and then drive home on pure paraffin. On these occasions when my return journey has lain over open roads I have suddenly felt the engine, as it were, take the bit between its teeth, and tear along with me at speeds never attained upon normal fuel; and yet on these occasions it has never failed to stop when the current was switched off, and the increase of speed has been consequent upon gross overheating, and has taken some miles of running as a first condition, and a short spell of very favourable speed conditions for a second condition.

We have just received a copy of the "Annuaire de Route" of the Automobile Club de France. This useful publication is practically indispensable to those who intend touring on the other side of the Channel. The information it contains is of the greatest possible value, as it mentions the smallest villages in France and particulars of their hotels, repairers, tyre depots, etc. Last year we used the book constantly, and found it to be absolutely reliable.

A RUN ON A FOUR-CYLINDER F.N.

THROUGH the courtesy of the F.N. Motor Agency, of 106, Great Portland Street, W., we recently had an opportunity of trying a $4\frac{1}{2}$ h.p. four-cylinder F.N. motor bicycle, and we were very agreeably impressed by the speed, hill-climbing capabilities, and smooth running of this excellent machine, which, as our readers know, is constructed in one of the largest small arms factories in Europe, viz., the Fabrique Nationale at Liege. Whatever opinion may be expressed with regard to multiplicity of cylinders on motor bicycles, there is no doubt that the four-cylinder F.N. is a flier, and, properly handled and kept in tune, it will compare most favourably with any other machine on the market of equal power. As might be expected, it starts with great ease—in fact, it is probably the easiest motor cycle engine to start—due to the four cylinders and the moderate gear with which it is fitted. We must admit that previous to trying the machine we had the opinion that with a gear of six to one, which we believe is the standard, the speed would not be very high, but a run on the machine convinced us that the engine is capable of an extremely high number of revolutions per minute, which enables the machine to attain a speed which is quite fast enough for average British roads, and faster than is required for touring. Hills it takes in its stride—at least those hills which we tried it on with grades of about 1 in 10 and 1 in 11. Long hills do

not tire it or cause the engine to overheat, and there are only one or two things we can suggest which would improve this machine. One of these is the brake, which is of the back-peddalling variety. This necessitates the feet always being on the pedals. Footrests would be preferable, and a separately controlled pedal actuated brake. The other improvement we should like to suggest is in the nature of the control. Handlebar control to the carburetter would make this machine ideal. At present, there is not much difficulty in controlling the engine, but we feel sure that handlebar control would provide a very much more delicate manipulation, and we should strongly advise the makers to give this point their attention. The spring fork is excellent, and all the other details of the machine are well carried out. The humming of the gear is strange to the rider after a belt-driven motor bicycle, but the immunity from transmission troubles fully compensates for this, and in the course of an hour or two's ride one becomes quite accustomed to the purring of the gear—in fact, provided it is well lubricated, it is no detriment whatever. Good workmanship and reliability have made a name for the four-cylinder F.N., and it is daily gaining favour. Riders who have tried it are very enthusiastic with regard to its capabilities and sweet running, and several to whom we have spoken concerning it say they would not return to a single or twin-cylinder machine.

A SPECIAL LEVER.

THE "sector" or quadrant lever is a form of hand lever which is found specially suited to many systems of motor driving, many tricar owners having a special predilection for this type in preference to any other where it can conveniently be used. Hitherto there has been nothing on the market specially adapted for use in connection with the Bowden wire mechanism, and to remedy this the E. M. Bowden's Patents Syndicate, Ltd., have just introduced the pattern illustrated here. It is supplied for either right or left side, and, like all levers operating the Bowden wire, can be placed practically anywhere on a tricar within reach of the

driver's hand. The illustration requires little explanation, and will no doubt convey a clear idea of the lever. A is a milled knob operating a pawl, which with its return spring are concealed in the stem B. The pawl engages with the rack C, and is released by pulling the milled knob A. E and D represent respectively the Bowden wire and its "stop."

SUGGESTED WATERPROOF OVERALLS.

"SURGEON," East Anglia, sends us the drawing (reproduced) of a pair of overalls for medical motor cyclists. They are ordinary overalls, wider than usual, and with a tuck

from knee to leather sole, so that they can be slipped off, leaving the shoes or boots quite clean. The soles should be ribbed or nailed like football or cricket boots. A medical man wearing the ordinary overalls finds them unsuitable for paying calls on a succession of patients, but the above would fill the bill. Instead of a hole to button over brace button, a clip could be fitted, as on many belts.

"Surgeon" is having a pair made to order, but feels certain that if put on the market there would be a good sale. "Special ailments require special remedies," and there is no doubt that motor cycling is a pastime that requires special clothing. The ideal motor cycle suit has yet to be made.

Through Many Lands by Motor Cycle.

Our readers will doubtless remember that we published a few months back a paragraph stating that Mr. E. M. Baxter, an American journalist, was leaving England for a lengthy motor cycle tour on the Continent of Europe, which would probably be extended to the northern shores of Africa. We arranged with this gentleman that we should publish a series of articles describing his experiences, and we are pleased to be in a position to place this week the first instalment of an article from Mr. Baxter's pen before our readers. The writer is an American and Agricultural Editor of *The Buenos Ayres Herald*, therefore his opinions on Europe and European customs will be read with interest. Further instalments will be published as they are sent in and space permits, but we must ask readers not to look for the articles as a weekly feature. Mr. Baxter's movements are necessarily somewhat doubtful owing to his professional engagements, but the continuation of "Through Many Lands by Motor Cycle" will be inserted whenever the exigencies of space permit.

FROM the unkept trails of South America to the well-made roads of Europe is a transition that impresses one with the old world means of travel by carriage. The railways and the steamers of South America are the equals of those of Europe in general, but they are confined to the thin fringe of settlements on the coast and along the mighty navigable rivers of the interior. An important exception to this is found, it is true, in the Argentine Republic, where extensive systems of railroads, chiefly due to British capital and enterprise, are laid in all directions across the great fertile grain zone of the Pampas. Away from the more populous sections of the continent there is now and then a stage route, and in some districts journeys of a few score miles may be tediously made by carriage, automobile, or cycle. The chief means of travel, however, outside the narrow zones served by train and steamer, is the saddle horse. But journeys made on horseback naturally entail very considerable inconveniences and difficulties, and frequently some danger. There must be a guide and servants, and the major part at least of the requisites of living must be taken on pack animals. Beyond the frontier an armed escort is necessary to guard against possible assault by natives or renegade whites.

American and European Roads Compared.

Rio, Buenos Ayres, and other progressive cities of South America have some well-paved streets and excellent park roads open to all classes of vehicles, but in no case are the roads leading from the cities comparable with those that radiate from all European towns. The best are mere tracks on the soft earth, cut up at all times by the wheels of heavy carts, and made almost or quite impassable in wet weather by the mud.

From the nature of the roads it is evident that there is no place in South America suitable for the sport of motor cycling—at least no place worthy of consideration. The disposition to engage in the sport is not lacking, particularly among the tens of thousands of people of British extraction. As an evidence of this disposition, a very small number of motor cycles may be seen on the boulevards and in the parks of some of the larger and more enterprising cities. But so circumscribed are the opportunities for the use of the motor cycle even in the most favoured centres of popu-

lation that few care to engage in the pastime. A man may row or ride or shoot in many parts of South America under true amateur conditions, but motor cycling is practically out of the question to-day, and many to-morrows will become yesterdays before there can be any radical change.

In view of the means of travel to which he is accustomed, it is not surprising that the man from South America looks with admiration, and even a little longing, on the splendid roads of Europe. Here the traveller who is not under the necessity of making a long tour in a short time is strongly drawn to the wonderful highways. A great variety of vehicles, mechanical and otherwise, are seen everywhere, beckoning one to use and enjoy. Soon the man who is accustomed to the saddle is attracted to the powerful and rapid motor cycle—it calls insistently for a trial. And why not give it the place of the horse? It is easy to drive, economical to use, and it makes possible a trip into many an enchanting district closed to travellers tied to train, river, and tourist agencies.

When the writer succumbed to the allurements of the motor cycle the problems to be solved in its adoption as a means of travel were the exacting demands to be made on a machine in a tour that seemed likely to exceed ten thousand miles in the Old World, with the probability of its being prolonged in the New several thousand miles besides. All kinds of roads would have to be traversed and every condition of weather encountered. Countries civilised and densely populated and countries semi-civilised and sparsely populated would be travelled. A machine that is eminently satisfactory on the good roads of Britain might give no end of trouble on the uneven and dusty surfaces of the highways of the Iberian Peninsula or on the burning sands of Mediterranean Africa. A motor cycle that will carry the unencumbered ten stones rider throughout tourist Europe without strain might soon break down on the rough and difficult roads of America and Canada. Fuel of varying degrees of excellence would have to be used, and in some districts substitutes for the usual fuel might have to be found. In the face of such momentous questions the novice decided to seek expert advice concerning the type and make of motor cycle it would be advisable to procure. Very small indeed was the number of machines designated

Through Many Lands by Motor Cycle.—

as being likely to meet the requirements of the severe demands of the proposed trip. As more than half of the advisers consulted recommended a Triumph this was the one ultimately selected. How well it has justified the encomiums given it will be apparent by the results obtained in its use.

Early Attempts.

In the latter part of last January it was handed over to the writer at the works, Coventry. An expert motor cyclist was detailed to initiate the novice into the mysteries of the new machine—mysteries which proved to be very simple indeed. First the mechanism of the cycle was studied with some care, after which the machine was taken to the street and a half-hour spent in learning to drive it. The novice was aided to start by the instructor. He rode down the street a few yards at slow speed, stopped, turned round, and waited for the instructor to come up and help him get away on the return. Each time the start was made with the learner in the saddle, as he particularly wanted to begin in this way. He would not have needed this

C. B. Grimshaw, of Sunderland, and his new 20 h.p. twin-cylinder machine, one of the highest-powered motor bicycles used on English roads. The bore is 115 mm. and the stroke 125 mm., and the total weight 300 lbs. A single coil is fitted and a special distributor.

help from the instructor had he been proficient in the use of the free-wheel and pedals. On the following morning another half-hour was spent in practice in the street, succeeded by a run of several miles in the country "like an old hand." The novice then felt safe in setting out alone on his trip south. This trip of about a hundred miles was made at the rate of some ten miles an hour. The roads were in a "prime state of grease," rains having been both frequent and heavy for a number of days. During the run the wind blew a gale most of the time, accompanied by frequent squalls of rain and sleet. Several herds of sheep and cattle were successfully "wriggled through," although in most cases the drovers made no attempt to clear a track. In fact, they seemed to think it clever to obstruct the course of a motor cyclist. One "crew" became very abusive when the engine slowly opened a way by means of loud and continued hooting and hissing. In another place a half-grown boy deliber-

ately drove a cow in front of the rider, but an accident was averted by the prompt application of the brakes and the cutting off of the power. Two automobile "road hogs" were encountered. One forced the wheelman into the soft rather stiff mud at the side of the road at a sharp turn, but, thanks to the non-skidding rear tyre, the danger of side-slip was safely passed; the other "shaver" rushed by from behind, apparently almost scraping the rider's body, and nearly causing him to fall from the suction of the swiftly moving car. As London was approached the dense traffic was rather annoying, but a clear though tortuous course was maintained by running very slowly and freely using the hooter.

The management of this particular motor cycle was so easily learned, undoubtedly, because of the following facts:

1. The handle-bar control.
2. The low centre of gravity.
3. The non-skid rubber studded cover on the rear wheel.
4. The ease of steering.

W. H. Bashall and his 20 h.p. Jap-engined Bat bicycle. This machine is capable of terrific speeds; in fact, we should imagine the chief difficulty is to control its speed. The cylinders measure 120 mm. each way. Mr. Bashall will ride his Tourist Trophy Triumph in the End-to-end Run.

Moreover, the seat being low, the rider can place both feet "squarely" on the ground at the same time—a matter of no small importance on rough and "greasy" surfaces. Another point exemplified in the writer's learning to drive the Triumph is that the beginner does not need to be an expert pedal cyclist. The writer can hardly be said to have been a cyclist, since his little riding experience was more than a dozen years back, and even then was limited to less than five hundred miles on a *fixed* pedal bicycle. His greatest difficulty in mastering the motor cycle was to get control of the free pedals in starting off. Even mature age need hardly be given consideration by the man who has the sporting disposition, provided he is young in spirit, as the man of sixty may engage in the sport of motor cycling with all the assurance of an easy and successful beginning and the full after enjoyment that are popularly supposed to belong peculiarly to youth.

(To be continued.)

The Diamond Motor Bicycle.

HANDLED by the Victoria Trading Co., 47, Lamb's Conduit Street, W.C., the Diamond motor bicycle made its *début* before the British public in the early part of the current year. It is a machine following absolutely standard lines, embodying all those points which are desirable on a modern machine. The frame is low and long, the rider's position comfortable, and the appearance in general pleasing. The machine is made in four models—B, C, D, and E—to suit all types of riders. Model B is moderate in price, of $2\frac{1}{2}$ h.p., 70 by 70 mm., a.o.v., single-cylinder, has 26in. wheels, girder forks, and $\frac{5}{8}$ in. rubber belt. Model C is of $3\frac{1}{2}$ h.p., single-cylinder, 78 by 84 mm., m.o.v., overhead system, has petrol and oil tanks arranged separately, $2\frac{1}{4}$ in. tyres, and $\frac{1}{2}$ in. rubber belt. Model D has a twin-cylinder engine, 65 by 72 mm., a.o.v., but otherwise resembles the aforementioned model. Model E is particularly worthy of notice, in that it has a 5 h.p. twin-cylinder engine, 73 by 78 mm., fitted with mechanically-operated valves excellently arranged—a point which is generally neglected in the case of twin-cylinder engines. The following standard fittings are common to all the above. Bosch magneto ignition, chain driven, chain in oil-tight case, F.N. carburetter with variable air control, spring forks (except with Model B) of excellent design, and a complete set of tools with each.

Reverting to the inlet valve arrangement on the 5 h.p. and $3\frac{1}{2}$ h.p., this is by means of adjustable overhead tappets—a system which has proved to be effective on similar types of engines, notably the N.S.U., one of the advantages being that the valves operate automatically at high speeds and mechanically at low speeds, and also should anything go wrong with the valve gear the valves can easily be made to work

A specimen of a twin-cylinder Diamond with magneto ignition and spring forks.

automatically if a weaker spring is fitted.

The engines, we understand, are made by the F.N. Co. Most of the machines are finished in French grey—a colour which does not show the dirt.

THE MATCHLESS FLEXIBLE BELT FASTENER.

NOW that adjustable pulleys are so popular among motor cyclists, any accessory which will tend to facilitate their use will be heartily welcome. As will be seen from the accompanying illustrations, the belt fastener has a flexible connection composed of a small piece of roller bicycle chain, giving four distinct adjustments, such as may be desired when the adjustable pulley gives a difference in the gear ratios of, say, from three and a half to six to one. The fibre block A is connected to a section of the chain, and when the fastener is extended to its fullest length serves to steady it as it passes round the pulley and prevents it from slipping. The illustrations are self-explanatory. The makers, Messrs. Collier and Sons, Herbert Road, Plumstead, S.E., are prepared to guarantee the Matchless flexible belt fastener for at least 1,000 miles.

MOTOSACOCHE HINTS.

Mrs. Edward Kennard is an enthusiastic user of a special Motosacoché ladies' motor bicycle, which has been built to her order by the Clyde Cycle and Motor Co., of Leicester. In a letter to the editor she gives an excellent tip for keeping the round twisted belt in order. The belt should be dressed inside with collan oil, and before rewinding filled with a soft cord. This prevents the diameter from shrinking too much. With some G.B. dressing outside this answers satisfactorily. These little engines are somewhat difficult to start at times, owing to the piston sticking through solidifying of the lubricant. If paraffin is injected while the engine is cooling and engine pulley turned a few times, it will be found that engine will start when required without any difficulty.

Our readers will remember that we published a paragraph a few weeks ago respecting the Three Spires non-skid tyre for motor cycles, and called attention to the fact that we should watch the progress of this tyre and report on same later. We are now in a position to state that the feeling of security from side-slipping and the immunity from ordinary punctures experienced on these tyres greatly increases the pleasure of motor cycling. The firm are also making a $1\frac{3}{4}$ in. cover for lightweight machines, which should be examined when specifying tyres on a lightweight mount. The non-skid $2\frac{1}{4}$ in. cover, 26in. in diameter, weighs $3\frac{1}{2}$ lbs., and has a very substantial indiarubber tread, and at the price at which it is sold is excellent value.

It's not only the ultra quality

of fabric and rubber, but the masterful method of "assembling," the fine workmanship, and the vast experience behind the workmanship, which are responsible for the acknowledged superiority of

DUNLOPS

ensuring

In answering this advertisement it is desirable that you mention "The Motor Cycle."

PALMER TYRES

The Palmer Motor Cycle Tyres are treaded with the well-known "rib," being designed to give a better grip on greasy roads. No side-slip attachments are needed with this ribbed tyre. The Palmer Motor Cycle Tyre for the same reason has a much smaller contact area with the road, giving a firmer grip and higher speed with less slip. Send for fully descriptive Booklet to

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied with a stamped addressed envelope for reply.

Irregular Running at Speed.

? I have a 4 h.p. Excelsior, single cylinder, accumulator ignition, trembler coil, Longue-mare carburetter. It runs perfectly at slow and medium speeds, but at its fastest it fires about twenty explosions and then one very weak one, which causes the bicycle to suddenly slow for a short time, and so jerks the rider forward. What would you say the cause was? Excellent spark, all wiring correct and tight, mixture all right, I think; the bicycle also uses a great amount of petrol.—C.B.

Without actually seeing the machine it is almost impossible to say what is the matter with it, but the weak explosion you mention sounds like pre-ignition, due to the deposits on cylinder head becoming incandescent. It may be that the contact breaker short circuits in one position, say when it is fully advanced. The excessive petrol consumption seems to lead one to suppose that the carburetter is not receiving sufficient air, or that the needle valve leaks, thereby causing flooding.

Cures for Sluggish Starting.

? I should be pleased if you could give me any information as to adjusting my magneto and carburetter for easy starting. The machine is a $3\frac{1}{2}$ h.p. N.S.U. with Eisemann magneto, and this is my only trouble. The machine is excellent in every way except the consumption, which is about fifty or sixty miles to the gallon. (1.) What are the points to look at to tell if an N.S.U. carburetter is in good order? (2.) What height should the petrol rise in the jet to ensure easy starting?—B.T.J.

Probably the difficulty in starting is that you get too much air at slow speeds. There is a revolving shutter on the carburetter which you could adjust to reduce the air inlet slightly. Clean all the terminals of the magneto, coil, and wiring, and make sure the handle switch is not shorting. The contact breaker should be cleaned with petrol, and the platinum points filed if they show signs of pitting. (1.) See that the carburetter takes nearly all the air when the machine is travelling fast. If not the jet may be choked, or the filter stopped up. (2.) To within about $\frac{1}{8}$ in. of the top of the jet tube.

Respecting a Sidecar Attachment.

? I am riding a $3\frac{1}{2}$ h.p. 1907 Quadrant, and wish to attach a sidecar to same; total weight of passengers nineteen stones. I have been told that owing to the Quadrant spring forks a Montgomery sidecar would best suit it. The motor is at present geared 4 to 1, and I understand that a variable pulley would be necessary. As I gather from *The Motor Cycle* that belt troubles are frequent with sidecars, I should be obliged if you would advise me as to the proper width and make of belt for sidecar work?—BO 221.

Spring forks are quite suitable for use with a flexible sidecar, and with rigid sidecars also, but some spring frames are unsuitable for sidecar work. A two-speed gear would be better than an adjustable pulley, but the latter you would find an excellent substitute. Gear the machine $4\frac{3}{4}$ to 1. The largest sized belt would be best for your purpose. say 1 $\frac{1}{2}$ in. section of reputable make.

A Mysterious Loss of Compression.

? I should be very glad if you could tell me why my engine (3 h.p. Quadrant 1905 pattern surface) has suddenly lost its power? I dismantled engine, cleaned piston head, removed rings, found a lot of burnt oil deposited in slots, ground in new inlet and exhaust valves, new springs, also new tappet fitted with correct clearance. I got excellent compression when engine was put back in frame, but after a mile's run nearly all compression was gone. Have had engine down three times since, but valves are all right and rings are not discoloured. I get good compression each time I put cylinder head on, but after a little running it goes again. The timing is correct with a machine of similar pattern. Do you think the fault lies with the rings? (Machine has always run to my satisfaction until now.) Or would you advise me to go in for a new cylinder head, piston, and rings?—H.B., S. Africa.

As you live so far away from England it would almost be advisable to purchase a new cylinder head, piston, and rings, but under ordinary conditions all we should think necessary would be new piston rings. It would be a good plan to fit new washers to each of the

joints to make sure there is no leakage, and also ascertain that there is sufficient clearance between the exhaust valve stem and tappet. Your trouble sounds very much as if the valve expands when the engine becomes hot, and is consequently prevented from closing fully. You do not say if the slits in the rings get into line.

A falling off in Power after 1,500 Miles.

? I ride a 1908 Triumph, have travelled about 1,500 miles, and it runs splendidly. I have never had the slightest bother, but lately it will not climb a certain steep hill about here (Offley) which when new it would fly up. I get going all out at the foot of the hill, but when threequarters of the way up the firing suddenly becomes much weaker (no misfiring), just the same effect as if I had nearly closed the throttle. The machine travels a few yards with weaker explosions, then gives a slight knock or two and stops. I have tried shutting off air and retarding spark as speed decreases. Compression good as when new, valves carefully ground. Ignition good, never had misfire, starts almost at walking pace, and will run at same. Carburetter floods, also when flooded petrol drips from jet chamber. When driving all out at the commencement of hill with the tank full or nearly full, petrol is squirted from the hole in the filler cap; in fact, a jet will rise quite 6 in. from this hole. This only happens when driving with throttle full open on steep hill before the engine fails.—W.H., Herts.

You do not mention if you have removed the cylinder as yet in order to scrape away the carbon deposits on piston head and cylinder. Absence of carbon means a considerable improvement in the climbing powers of an engine. It is just possible that the exhaust valve spring may have lost some of its temper, and a new spring may restore some lost power; in fact, both valve springs should be looked to. It may be that some foreign matter has found its way into the carburetter, and it would be a good plan to dismantle it and clean all the passages, also the feed pipe. The squirting of petrol from filler cap is probably due to the speed at which you travel when rushing a hill. Fit a helmet or other lubricator to the filler cap.

CURRENT
CHAT.Special
FeaturesTHROUGH MANY LANDS
BY MOTOR CYCLE.TUNING UP FOR THE
END-TO-END.

Scottish Speed Limits.

In practically every village in Scotland through which the End-to-end Trials competitors pass, there is a ten miles an hour speed limit which must be strictly observed. Any rider against whom there is any complaint of reckless or inconsiderate driving will be disqualified from receiving an award.

A Lady Motor Bicyclist in the End-to-end.

Miss Hind told us last week that she had been reluctantly compelled to give up the idea of driving her new tricar in the End-to-end Run, owing to difficulty in finding a suitable lady passenger. She does not, however, intend to miss the event, and has accordingly entered her motor bicycle. A lady who can ride 400 miles in twenty-two hours (witness the London-Edinburgh Run) should encounter no obstacles in a six days' jaunt.

Brice Progressing Favourably.

Readers will be glad to hear that R. M. Brice, who met with an accident during the London-Edinburgh Run, is progressing favourably. Enquiries have been received from all parts as to Mr. Brice's injuries, but it is quite impossible to reply to them all by letter.

The Demand for Motor Cycles in U.S.A.

A firm in Los Angeles, California, U.S.A., advise us that their total turnover for one year in complete motor cycles and accessories amounts to £40,000. We should think this is almost a record for a motor cycle agency business, and gives an idea of the amount of trade being done in motor cycles in the land of stars and stripes.

A Five Miles Track Race.

At Chesterton, Cambridge, on Thursday, the 9th inst., a five miles handicap for motor cycles will be held. The hon. sec. is C. E. Woods, 12, Pretoria Road, Chesterton, Cambridge.

Police Traps.

Two police traps near to Llandrinodod have resulted in six motorists being fined a total of £18.

A trap was started last week between Newcastle (Staffs.) and Stone.

Between Stone and Colwich there is a four miles trap in operation.

Another Race Meeting at Birmingham.

The following events will be included in the *Sport and Play* Tournament at Aston, Birmingham, on Saturday next: Five miles tourist handicap, mile handicap for 76 by 76 mm. engines, and five miles handicap for 76 by 76 mm. engines.

Flying Kilometre at Le Mans.

On June 21st the Automobile Club de la Sarthe conducted time trials over a flying kilometre. There were three classes for motor bicycles and

The Danger of Repairing Petrol Tanks.

A gasfitter of Tondû (Wales) recently received fatal injuries caused by the explosion of a petrol tank which he was attempting to repair. The tank was emptied at eight o'clock the previous night, and all the holes in the tank left free for any gas to escape. Deceased was using a blow lamp, when suddenly the tank exploded, and the poor fellow was struck on the head and killed.

Motor Cycle Race in Rhodesia.

Evidently there are no police regulations with regard to the speed of motor cycles in Rhodesia. On May 25th a race was held in connection with the Caledonian Sports, Salisbury, Rhodesia, over a distance of about thirty miles. The surface is described as an unmade dirt road, and there were three "spruits" to cross. The course included a climb which raised the competitors and their machines a thousand feet, and in places the surface was very stony. Competitors on Bats, N.S.U.'s, Triumphs, and Vinceds rode over tracks which would have astonished English riders. To quote our correspondent, "It was bump over the lumps, wriggle through the sand, and dash through the water." The scratch man, Dr. F. E. Appleyard, whose weight is fourteen stones, mounted on a 5 h.p. twin-cylinder Vindec, completed the distance in 56m. 9s. (fastest time). Next came a rider of a 3½ h.p. Triumph, two seconds slower, and a Bat 69m. 58s. Dr. Appleyard had to give the Triumph 13m. start. the Bat 19m., a 3½ h.p. 1905 Vindec 13m., and a 4 h.p. twin N.S.U. 8m.

London-Edinburgh Run Statistics.

From the official list of gold medal winners in the M.C.C. London to Edinburgh and back run, published on page 502 last week, it will be seen that—

Nineteen Triumph riders gained gold medals on the outward journey. None returned in competition.

Twelve Vindec riders gained gold medals on the outward journey and one a silver medal. Four of these won double journey medals.

Seven Rex riders obtained gold medals and one a silver medal. Two of this number completed the return run in competition, and will receive double journey gold medals.

FUTURE EVENTS.

- July 6-7—A.C.F. Grand Prix Races for Cars and Voiturettes.
 „ 9—Five Miles Handicap at Chesterton, Cambridge.
 „ 13-18—A.C.U. LAND'S END TO JOHN-O'-GROAT'S SIX DAYS' RELIABILITY TRIAL.
 „ 14-15—M.C.U.I. (Ulster Centre) Open 400 Miles Reliability Contest.
 „ 18—London and South Western Bank Five Miles Motor Cycle Race at Herne Hill.
 „ —A.C.U. 24 Hours' Ride, London to Plymouth and back.
 Aug. 3-4—Motor Cycling Club Run to Land's End and back for Charles Jarrott Cup.
 „ 8—Essex M.C. Open Race Meeting at the Stadium.
 „ 15—Coventry M.C. Open Hill Climb for Motor Cycles.
 „ 22—A.C.U. Annual Race Meeting at the new Stadium, Shepherd's Bush.
 „ 29—Essex M.C. Open 200 Miles Non-stop Run for Motor Cycles.
 Sep. 12—Motor Cycling Club Petrol Consumption Tests.
 „ —The International Auto Cycle Tourist Trophy Race in the Isle of Man.

one for tricars, and competing machines were timed with a Mors electrical timing apparatus. The results were: Class 1, Chabal (Motosacoche), 1m. 34½s. Class 4, Boulay (Pax), 50s. Class 5, Farnaud (Réné Gillet), 50½s. Tricars—Seray, 1m. 25s.

Of Interest to Midlanders

Motor cyclists in the Midlands will probably be interested to know that the Gloucestershire Pageant commences at Cheltenham on July 6th, and will be continued until July 11th. Cheltenham is called the Garden Town, Spa, and Beauty Spot of England. Evening entertainments have been arranged for the whole of the week, and a battle of flowers and decorated motor car parade will be among the attractions.

Motor Cycle for Business Purposes.

The North Metropolitan Electric Power Supply Co. has purchased a L.M.C. motor bicycle from the Service Co. for the use of one of its inspectors in connection with his official duties.

End-to-end Run.

Four members of the Newcastle and District Motor Cycle Club have entered for the A.C.U. End-to-end Six Days' Run, July 13th to 18th. Capt. Sir R. K. Arbuthnot, Bart., R.N., Messrs. A. D. Nicholson, W. H. Outwin, and S. W. Carty.

Additional Entries for the End-to-end Run.

Further entries for the Land's End to John-o'-Groat's Run received up to the time of going to press were O. C. Godfrey (3½ h.p. Rex), A. J. Sproston (— h.p. Rex), G. Lee Evans (3½ h.p. Rex), Leofric Cutler (3½ h.p. Triumph), H. Ellison (1½ h.p. Motosacoche), J. V. Robinson (1½ h.p. Motosacoche), W. F. Merritt (3½ h.p. Triumph), J. Fwing Adam (3½ h.p. Triumph), Miss Muriel Hind (5 h.p. Rex), W. Milnes (3½ h.p. Phelon and Moore), G. L. Fletcher (2 h.p. Moto-Rêve), W. Smith (2 h.p. Moto-Rêve), C. A. Palmer (4 h.p. Rex), W. Newman (4 h.p. Rex), A. D. Powell (3½ h.p. B.P.), S. H. Richardson (5 h.p. F.N.), H. B. Lewis (3½ h.p. Triumph), A. M. Tatham (3½ h.p. J.A.P.), W. Weatherilt (3½ h.p. Zenette), F. W. Barnes (3½ h.p. Zenette), and J. Stuart Shaw (5½ h.p. Phänomen with sidecar).

Race Meeting at Leipzig.

A thunderstorm interfered with the meeting (June 21st) organised at the Leipzig cement track by the local branch of the German Motor Cyclists' Association, but the main events could be run off, and they afforded capital sport. Thirty-five men were down to start in the various races, eighteen having entered for the hour alone. Georg Retienne proved the hero of the occasion, placing the kilometre, the 25, and the hour to his credit. It is noteworthy that for the first time in the history of the track over ninety kilometres were covered on it in the hour, Retienne's distance for that time being 93.685 kilometres, or only a few yards short of 58 miles. The kilometre with flying start he polished off in 35½s., some 63 miles 892 yards. We append results of the three principal races, for each of which, owing to the strong entry list, preliminary heats were found to be necessary:

Twenty-five kilometres (open to all riders and motors up to 5½ h.p.)—1, Retienne (Progress), 15m. 43s.; 2, Ludwig (Magnet), two and a half laps behind; 3, Walther (Cito), three and a half laps behind.

One kilometre (flying start for all machines and riders).—1, Retienne (5½ h.p. Progress), 35½s.; 2, Wiencziers (8.7 h.p. Puch); 3, Oberländer (7.3 h.p. Mars); 4, Schmidt (7.6 h.p. N.S.U.); 5, Ludwig (5½ h.p. Magnet).

One hour (open to all machines and riders).—1, Retienne, 93.685 kilos.; 2, Wiencziers, 92.820; 3, Oberländer, 92.820; 4, Müller (5½ h.p. Magnet), 74.430. Retienne and Wiencziers struggled desperately for the lead, and furnished the spectators with numerous thrilling moments.

Another Motor Cycle Race.

The London and South-western Bank Sports Club will include a five miles motor cycle race at its annual meeting at the London County Athletic Grounds, Herne Hill, on the 18th inst. The hon. secretary is Frank White, 170, Fenchurch Street, E.C.

Reliability.

The Sunderland club held its third annual reliability trial for the Vaux Challenge Cup on Wednesday last, and for the third year in succession Mr. E. J. Tiffin, riding a 4½ h.p. twin-cylinder Minerva bicycle, finished without losing a single mark. This year's winner has not yet been declared, as three riders lost no marks.

London to Edinburgh Competitors Fined.

C. H. Crole-Rees appeared at the St. Neot's County Court last Thursday for exceeding the speed limit at Buckden on the return journey in the London-Edinburgh and back run, and was fined £3 2s. and 18s. costs. Several other competitors are due to appear at the same court within the next few days. We understand from a victim that it is best for the offending motorists to appear at the court in person.

Examine Handle-bar Stems.

A correspondent asks us in the interest of the pastime to warn riders against handle-bars with too short a stem. He says he is just recovering from a nasty accident due to the handle-bar stem coming clean out of the socket. In all probability it had been raised without verifying what amount of tube was left in the socket. There should never be less than 3½in. to 4in. of handle-bar stem in the socket, and the one tube should be a good telescopic fit into the other. Then the ball head clip is not unnecessarily strained to obtain the correct degree of tightness.

Newcastle M.C.

The second annual reliability trial of the above club was held on Thursday last to Levenhall (Edinburgh) and back for the Arthur Lucas Challenge Bowl. We are obliged to hold over the report of the run until our next issue.

M.C.U.I. Inter-centre Contest.

The Ulster centre of the Motor Cycle Union of Ireland easily won the Triumph Cup reliability trial last Saturday, twenty-two members riding against eight of the Dublin centre. The course measured 96¼ miles. Next week we shall give a report of the contest.

Team Trials Notes.

The Yarmouth team had perforce to travel many miles to reach Daventry, and this year they made a particularly good show. At the end of three sections (seventy-five miles) the team was only one rider short, and but for the loss of twenty-five marks owing to a competitor travelling too quickly, the score would have been 486¼. As it was the team finished second. All the Yarmouth competitors' machines had imitation bloaters on the front mud-guard.

The Coventry Club made a record score on Saturday with 536 marks.

The sidecars used by the team trials competitors were of all patterns, Montgomery, Mills-Fulford castor wheel, and rigid.

It is strange that not a single team's passenger representatives covered the full course without a stop.

A number of competitors carried small petrol cans on their backs as they were none too sure their machines would complete the hundred miles on one tank full, and replenishments were not allowed.

J. W. Woolston (5 h.p. Rex), one of the Yarmouth team starting from a standstill by means of the Roc clutch.

COVENTRY M.C. WINS THE CUP OUTRIGHT.

LAST Saturday's team trials were undoubtedly the most interesting yet held by the Motor Cycling Club; firstly, owing to the very representative entry of nine clubs; secondly, because the course is a sporting one, including one or two quite respectable gradients; and, thirdly, because a win for the Coventry M.C. meant that *The Motor Cycle* fifty guinea challenge cup would become that club's own property. The start was arranged to take place at ten o'clock, and one hour before that time the neighbourhood of the Peacock Hotel, Daventry, resounded with the noise of the competitors' machines. Most of the teams with the reserve men arrived in Daventry overnight, but the Sheffield "blades" are a hardy lot, and left home shortly after midnight for the scene of operations, all duly arriving at 8 a.m.

53 Starters out of 54 Entrants.

After number cards had been attached to competitors' machines, back and front, a move was made to the Banbury Road, about half a mile out of Daventry. Quite a crowd had collected here to see the start, and the line of competitors extended a considerable distance down the road.

The weather was dull, but fine, when punctually at 10 a.m. Mr. F. T. Bidlake, the timekeeper, gave the first competitor the word to go, and at half-minute intervals the remainder were despatched. Four motor bicyclists and two passenger motor cyclists represented each team, but one of the Birmingham Club's tricarists failed to put in an appearance, so this club's chances of a win were remote from the first. At every mile or so along the twelve and a half miles course (which, by the way, is one of the prettiest roads in Northamptonshire) a marshal was stationed to note stoppages should any occur, and, in addition, there were several travelling marshals who rode up and down the course. A stop for any cause, except exigencies of traffic, was not permitted. The road was in splendid condition, albeit very dusty. Some of the riders who had not indulged in a practice spin over the course were glad they had pedals before completing the outward stage. The weeding out process commenced early. At eleven miles F. W. Barnes (Yarmouth) stopped, a pin operating the change speed gear coming adrift. V. F. Gray (Manchester) also stopped at this distance, the contact breaker blade of his tricar having shifted. At the turning point (four miles from Banbury), G. F. Cooper

Lining up for the start of the M.C.C. Team Trials at Daventry last Saturday.

M.C.C. Team Competition.—

(Oxford) retired with a punctured tyre, and at fifteen and a half miles R. W. Duke (Birmingham) suffered the same fate.

After leaving Chipping Warden on the return journey there is a long rise to negotiate, and we should estimate that the gradient is steeper than 1 in 12. It proved too difficult for J. W. B. Durant's machine (Sheffield), which was single geared and pulling a trailer. Several other riders only climbed the hill by dint of hard pedalling. Durant told us it was steeper than any hill he had encountered on the journey from Sheffield. J. E. Tytler (Manchester) had almost completed one stage when the pedal chain of his machine came off and wrapped round the back wheel. At this point other minor troubles befell W. H. Wells (M.C.C.), W. Portwine (Southern M.C.), and F. Thomas (N.W. London). Only the Coventry team finished the first stage of the 100 miles run complete, and thus early they were looked upon as the likely winners. It should be mentioned that the Coventry representatives had left nothing to chance; they had prepared for the competition systematically, and were pretty confident of their ultimate success.

The next twenty-five miles saw the retirement of W. Heaton (Southern M.C.); G. Lee Evans (Coventry), belt pulled through; F. Organ (Oxford), failed on hill; G. H. Hollis (N.W. London); and at this stage an adjournment was made for lunch, during which time the machines were locked up by the officials.

The Second 50 Miles.

On the way down to the starting point for the second "fifty" the M.C.C. lost another representative, a valve of Dr. Brewerton's engine giving trouble.

On the restart the three clubs appearing to have the best chance of the cup were Coventry, Sheffield, and Yarmouth. The Southern M.C. lost the third rider in A. W. Holt, who retired with a seized engine. One of the passenger machines belonging to the Sheffield club failed on a hill four miles out, leaving the Coventry and Yarmouth clubs with five of their team going strongly. After three circuits the positions of the two clubs remained unchanged, but immediately on turning one of the Yarmouth motor bicyclists punctured, and the Coventry team, continuing to run like clockwork, eventually proved easy winners, scoring 536 out of a possible 600 marks. Last year the same club won the cup with 534 marks, and, having won in 1904 also, they became the absolute owners of it. The names of the teams, the machines ridden, and marks scored by the riders (subject to verification by the M.C.C. committee) were:

It must be mentioned that the success of this year's trial was due in a great measure to the untiring efforts of the trials hon. sec., Mr. J. Van Hooydonk.

CLUB NEWS.

Leeds M.C.C.

The results of this club's hill-climb at Sutton Bank last week-end were: Class 1.—Standard single-cylinder machine, none finished. Class 2.—Special and two-cylinders, winner, P. H. Cockcroft (3½ h.p. Triumph). Class 3.—Twins, Jack Scriven (5 h.p. T.T. Rex). Final.—Winner, Jack Scriven. The starter and scrutineer was Mr H. S. Atkinson; time-keeper, Mr. H. Wheeler; and judge, Mr. F. O. Langton.

Stockport and District M.C.C.

This club still continues to prosper. It was decided at the meeting on Friday last to hold a midnight run on July 11th and 12th to Leicester, returning home on the Sunday. The start will be from the Mersey Hotel, Saturday midnight. On July 25th and 26th a week-end run will be held to Llangollen and Llandudno. The night will be spent at Llandudno, returning Sunday, July 26th, start 2.30. Any motor cyclists who wish to join the club in any of the runs are cordially invited.

Lincolnshire M.C.C.

A very successful hill-climbing competition was held at Miles Cross Hill, Alford, on Thursday, by the Louth Centre of the Lincs. M.C.C. The distance was a mile, and some very good performances were made. Mr. Clarke, hon. sec. of the Louth Centre, conducted the arrangements. The results were:

2¾ H.P. CLASS.	Time.	Figure of merit.
J. E. Stones (2½ h.p. Ariel) ...	2 13 ² / ₅	7.8
J. E. Stones (2½ h.p. Olympic) ...	2 26 ² / ₅	

3½ H.P. CLASS.

L. A. Smith (3½ h.p. Triumph) ...	1 57 ² / ₅	7.9
A. Mettham (3½ h.p. Minerva) ...	2 32 ² / ₅	6.9

Six others competed.

TWIN-CYLINDER CLASS.

G. Cusworth (5 h.p. Peugeot) ...	1 33 ³ / ₅	5.3
C. Moore (5 h.p. Rex) ...	1 34 ² / ₅	4.9
W. J. Clarke (5 h.p. Rex) ...	1 30	4.7
J. W. Willson (5 h.p. Vindeo) ...	2 6 ³ / ₅	4.0

Sheffield and Hallamshire M.C.C.

The annual reliability trial was held on the 20th ult., from Sheffield to Bridlington and back, a distance of 170 miles. Sixteen started, and it was wonderful with what clocklike regularity they turned up at the controls, of which there were ten, and it was amusing to see how the competitors' watches were compared as each one lost one mark for every half minute early or late at controls. The winner proved to be W. Hill (5 h.p. Rex), who lost three marks, and won Mr. J.

H. Hall's five guinea cup. Second, S. Sawyer, lost five marks, won Mr. F. Dover's £2 2s. prize. Third, J. Arden, lost seven marks, won Mr. A. H. Bisby's case of razors, and the following qualified for the club's bronze medal: Messrs. Durant, Haslam, Donovan, Wanklyn, Turner, Kay, Allen, Saynor, Dover, Farrar, Swann, and Bisby.

Walthamstow M.C.

The hundred miles non-stop competition for the Annual Dinner Cup was held on Saturday last, when thirteen members started on a circular course running from North Weald to Ongar, returning *via* Grinstead, Blake Hall, and Epping Common. The competitors were required to cover the course six times, giving a total of 101 miles. The course was well marked, and the police kindly kept the course as clear as possible. Seven members qualified for the hundred miles medal, but a further run will be necessary to find the winner of the silver cup and gold medal. The results were: J. W. Percival (6-8 h.p. Fafnir tricar), non-stop; L. Beckers (5 h.p. twin Kerry tricar), non-stop; G. West (5 h.p. twin Singer tricar), non-stop; A. H. White (8 h.p. car), non-stop; F. A. Applebee (5 h.p. twin Rex), non-stop; O. C. Godfrey (5 h.p. twin Rex), non-stop; J. Meads (3 h.p. Fafnir), non-stop; F. W. Applebee (3½ h.p. Rex), punctured; A. G. Peppercorn (2¾ h.p. Anglian), punctured; W. S. Low (5 h.p. twin Rex), belt came off; R. J. Lises (5 h.p. tricar), punctured; J. D. Lacey (4-5 h.p. tricar), oil on contact; and E. H. Page (6 h.p. Rex Litette), stone jammed wheel.

Sunderland and District M.C.C.

The third annual reliability trial for a challenge cup presented by Major E. Vaux, of Sunderland, took place on June 25th. The course was from Sunderland to Doncaster and back, *via* Stockton, Thirsk, Topcliffe, Boroughbridge, and Wetherby, a distance of 220 miles. In addition to the cup, a silver medal, given by the North-Eastern Automobile Association, whose members were eligible to compete, was allocated as first prize, and a medal, given by the club, was to be awarded as second prize.

The following competed: S. Wilson (4 h.p. N.S.U.), Russell Jackson (5 h.p. Rex), E. J. Tiffin (4½ h.p. Minerva), F. Turvey, jun. (3½ h.p. Triumph), M. Scott (2¾ h.p. Minerva), and — Lambert (5 h.p. Rex).

Messrs. Wilson, Jackson, and E. Tiffin finished without losing any marks—a good performance. Mr. Turvey went into the control a minute before time. The times of start and finish were 5 a.m. and 6 p.m. respectively. Both medals were to become the property of the winners. As there was a dead heat between three competitors, it has yet to be decided how the trophies shall be apportioned.

Three Team Trials competitors passing through a typical Northamptonshire village on the outward journey of the 12½ miles course.

One of the successful team's passenger motor cycles, a 5 h.p. Riley. The driver is A. M. Startin and he is seen climbing the longest hill on the course.

Club News.—

G. W. Raper (6 h.p. N.S.U.) and A. D. Nicholson (3½ h.p. Triumph), two riders of the Newcastle and District M.C.C., who completed a Twelve Hours Run to Edinburgh and back inside schedule time. The trial proved a very arduous one on account of the very adverse weather conditions. The same pair won gold medals in the M.C.C. London-Edinburgh 24 Hours' Run, and Mr. Nicholson will compete in the A.C.U. End-to-end Trials this month.

York County M.C.C.

Next Saturday is the date fixed for the second quarterly trial for gold, silver, and bronze medals; and on the 18th inst. the twenty-four hours' run from Leeds to Edinburgh and back will be held. Readers willing to check the competitors on the outward and return journey at Alnwick, Berwick, and Dunbar are asked to communicate with H. Wilkinson, trials hon. sec., Garforth House, The Drive, Roundhay, Leeds.

Coventry M.C.

An open hill-climbing competition will be held on Saturday, August 15th, for motor bicycles and tricars. Particulars and entry forms will be available in a week or so.

Nottingham and District M.C.C.

On Saturday next, the 4th inst., the run is to Sir Peter Walker's, Osmaston Manor, near Ashbourne, where the grounds will be open for inspection. Members meet at the Welbeck Hotel at 2.15 p.m.

Basingstoke and District M.C.

A petrol consumption trial held by the above club on the 20th ult. resulted as follows:

Formulae: Class 1—Single-cylinder motor bicycles, $\frac{C}{W \times 20} = \text{F.M.}$
 Multi-cylinders (over 4 h.p.), $\frac{C}{W \times 30} = \text{F.M.}$
 Class 2—Cars, $\frac{C}{W \times 20} = \text{F.M.}$

CLASS 1.

--------------------------------------	---------	------	--------

Officials: Messrs. R. J. Joice, F. May, and T. Jackson.

We have received one of the latest Stanley belt fasteners specially made for use with adjustable pulleys. It is an ordinary Stanley fastener provided with three hooks of different lengths—¾ in., ¾ in., and 1 in. When raising or lowering the gear all that is necessary is to unhook the fastener and insert or remove one of the extra hooks. This fastener is also handy for riders who own motor cycles with fixed pulleys, as they can start out with the longest hook in position, and remove a hook as the belt stretches.

Worcestershire M.C. members at Rose Hill, Rednal, on the occasion of the hill-climbing competition described on page 503 last week.

A PROMISING LIGHTWEIGHT.

A 2½ H.P. twin-cylinder motor bicycle possessing many novel features is one built by Mr. E. G. Young, of Trent Bridge Garage, Nottingham, and illustrated herewith. The weight of the machine, we are told, is 90 lbs. The frame is a Chater-Lea, tyres special Continental, and belt 7/8 in. V. Bowden control is used, and the machine is built low with the engine situated low down in the frame. The tanks are brass, the petrol tank holding one and a quarter gallons and the oil compartment three pints. It will be noticed that a gauge is fitted. The mechanically operated inlet valves are not the least important point about the little engine. The ignition is by Bosch magneto. By unscrewing two bolts, the engine can be taken completely out of the frame. In other respects the machine is quite up to date, the spring forks and long handle-bars conducing to comfort in riding over uneven roads. We hear the machine is a good hill-climber and speedy on the level. We

may be able to say more about the machine's capabilities after a practical test, which we are expecting to make in a few weeks time.

A neat twin-cylinder lightweight, built by E. G. Young, Nottingham.

LETTERS TO THE EDITOR.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address

Lamps.

[3378.]—Might I suggest that new lamps should have the water compartment of generator washed out with shot or a few bearing balls, so as to remove incrustation?

Gas pressure should be introduced above water in generator, and so increase pressure at burner.

R. GRIMWOOD.

Fresh Fields to Conquer.

[3379.]—I have been much interested in reading about the Sutton Bank hill-climb in *The Motor Cycle*, and desire to inform you that, although I am a native and a motor cyclist, I have never heard of a motor cycle having been ridden up Clay Bank. A $3\frac{1}{2}$ h.p. Triumph I supplied to an old motor cyclist has got up the Ingleby Greenhow side of this hill, which is a trifle compared with Clay Bank. The latter is three miles from Stokesley on the main road through Great Broughton to Chop Gate and Helmsley. Motor cyclists, there is still a hill to conquer.

ALLAN BARKER.

New Use for an Electric Headlight.

[3380.]—Reverting to Mr. Cox's letter [No. 3362], "New Use for an Electric Headlight," it may be still further interesting to know that it is not at all necessary to make use of the lamp, or insert any resistance whatever between the two accumulators undergoing charging. Provided the voltage has not fallen below 3 volts, both cells may with safety be coupled up in parallel, when the internal resistance of the weaker cell is sufficient to regulate the current until both have attained their equilibrium. This I have done repeatedly without detriment to either accumulator.

A. ERNEST OLD.

Belt Fasteners.

[3381.]—With reference to the letters 3357 and 3361, during the shield competition held in Edinburgh on June 13th, I was much taken with a fastener, which I will try to describe. The ends were steel stampings with a steel liner inside, the belt ends being connected with a steel wire having a pivot on each end, and by a simple movement of pivot the belt can be instantly removed. I should be pleased if anyone can furnish me with the name of maker, etc.

S 747.

[We think a sample of this has been in "Ixion's" hands for a few days. Doubtless he will describe his experience in due course.—Ed.]

Air Cooling.

[3382.]—As American cars are running very successfully with air-cooled four-cylinder engines up to 60 h.p., it appears to me that if this system of air-cooling were adopted on motor cycle engines we should probably hear less of overheating. If they can make a success of them on cars, surely something more can be done in this direction on cycles.

On the American vehicles (one of which I recently inspected), the combustion heads and valve chambers are surrounded by a jacket which has a tubular connection, with a powerful blast fan made on the ordinary forge blower principle. The result is that a strong current of air is directed just where required, and in a perfectly uniform manner to each cylinder. The arrangement appears to me to be the obviously correct one.

D 1617.

Police Traps.

[3383.]—Regarding your article, "Police Traps," in *The Motor Cycle* of June 17th, I am sorry to say the police exceed their duty, and when they meet off duty they tell of the brave deeds they have done in stopping motorists. For no apparent cause there is a trap set between Llanfairfechan and Penmaenmawr, on the Bangor and Conway road, and another from Capel Curig and Bettws-y-coed. These are working Saturdays and Sundays, and are worked by means of a flag, which is not always in the same place. The roads at these points are wide and practically devoid of traffic.

CC 230.

The Practical Touring Machine.

[3384.]—In answer to "ES 186's" letter in *The Motor Cycle* of the 17th ult., I would like to point out, for the sake of the reputation of the Perth and District Motor Cycle Club, that only two machines turned out on the last holiday when the run was round by Fettercairn, viz., one Phelon and Moore and one $3\frac{1}{2}$ h.p. geared much too high. One would think from his letter that the whole club (which is over fifty strong) had tried the climb, and he was the only one who got up. At the same time, I would like to point out to "ES 186" that there is more than one machine in the club which could climb the Cairn o' Mount. If some of our English friends would like to see some real hills when in Scotland after the End-to-end run, I would recommend them to the following: Tornapness to Applecross (Inverness-shire); Mam Ratachan, near Shiel Inn (Inverness-shire); on the hill out of Ullapool, in Ross-shire. Any of these are much worse than any hill in England, and you can strike them all by coming back from Wick to Laing, and going down the West coast to Fort William. Any of the competitors, or, in fact, any tourist who can spare the time, will be more than repaid by the magnificent scenery.

A MEMBER OF THE P. AND D. M.C.C.

How a Hill-climb was Spoilt.

[3385.]—May I be allowed the use of your columns for a triple purpose—of apology, excuse, and protest. I wish in the name of the Barnsley Victoria C.C. motor section to apologise to members of the public and competitors for the trouble to which they were put at our hill-climb on June 20th, and which they took with such splendid good nature. I wish to excuse the officials of the club and myself. That our climb on Stainborough Lowe was stopped was no fault of ours. I had received from the local superintendent of police this statement: "You shall have no active opposition from us." At the last moment a trap was instituted on the hill, and two competitors were threatened with summonses for exceeding the legal limit. There was nothing for it but to go elsewhere, and this we did, not without regret at parting from our pet hill.

And now for the protest. The police had nothing to gain from this interference, unless it may be money. It is entirely their fault that time and money have been wasted, an afternoon's sport has been missed by the general public who came to the hill in large numbers, and feelings between police and motorists have once more been embittered.

Had it not been for the fact that the mobility of the modern motor cycle is greater than that of the village constable, we should have been left with a valuable trophy on our hands and no possibility of holding a competition for it.

BERNARD SIFFKEN,

Hon. Sec. Barnsley Victoria C.C. Motor Section.

The Behaviour of Rubber and Canvas Belts.

[3386.]—Whilst there is so much discussion and so many opinions on various classes of belts, I should like to give mine of the Camel rubber and canvas. Its qualities are not yet universally known, or I am sure it would be more used. Previous to trying the Camel, I used a similar pattern belt of a well-known make. This, after running about four hundred miles, shed the rubber from its side, thereby causing it to slip unless very tight. Seeing the Camel advertised in your paper, I decided to give it a trial, not expecting a great deal, as the price is much less than that of other makes. I ran it three hundred miles, taking out one block (lin.) only. It behaved so splendidly that I decided to take it through the London-Edinburgh run. This I did without experiencing any trouble, and after returning home by road I have since taken another block out. After running nearly 1,000 miles there is no sign of wear whatever. It never slips, and its elasticity is very good; therefore no undue stretch.

My advice to anyone who has trouble with other makes is to give the Camel a trial. The price is about half that of some makes, and I am certain, as in my case, it will be money well spent. I have no interest in the belt other than that of a very well satisfied user.

J. L. BARRATT.

Assembled from Miscellaneous Parts.

[3387.]—I am sending two photographs of a motor bicycle and sidecar made by a friend and myself completely from parts bought through the miscellaneous columns of your

excellent paper, *The Motor Cycle*. The engine is a $3\frac{1}{2}$ h.p. M.M.C., on a Chater Lea No. 6 frame. The tank is only a temporary one while the proper one is made. The sidecar is a Montgomery rigid pattern.

R. A. BONHAM CHRISTIE.

Tyre Troubles.

[3388.]—It is little wonder that such a large proportion of motor cyclists of to-day stick to foreign productions. The way in which some English manufacturers treat them is quite enough to warrant them going in for foreign goods.

About six weeks ago I bought an extra heavy tyre, and after about 200 miles wear I found the tyre had cracked right round close to the beading. On mentioning the matter to several of my friends, I found that four of their tyres were going in the same way. One of my friends sent his back through an agent (this tyre had only been in use a fortnight). The makers wrote back saying that the tyre had been ill-used, and had been ridden under inflated. I then sent my tyre to them, and received a reply that the rim must have been faulty, although it was a standard rim. A week ago I had a new machine delivered to me, and on looking at the tyres I found that the tyre on the rear wheel is going in the same way.

Surely all rims are not faulty, and all tyres ill-used and badly fitted. I consider that the makers are entitled to replace these covers free of charge, and by their not doing so they are only putting a noose round their own neck.

I know of a foreign made tyre in this town (West Hartlepool) used by a rider, which went wrong after being in use

for three months, and on him writing to the firm they willingly replaced it.

There is no need for any motor cyclists to be bothered with the ways of the English manufacturers when they can get better satisfaction from the foreign, and I think it is high time that tyre makers and other people in England were opening their eyes to this fact.

I hope you will find space in your valuable paper to insert this letter.

W. T. WALTON, JUN.

A Severe Hill.

[3389.]—While rambling about some Surrey lanes recently I came across a hill of such extreme severity that I am anxious to know if any of your hill-climbing readers have ever tackled it. It is not given in Gall and Inglis's *Contour Road Book*, but is on the regular by-road from Abinger to Effingham, in the triangle between Guildford, Leatherhead, and Dorking.

It runs from nine and a quarter miles on Route 564 to twenty-three and a quarter miles on Route 510. To get to it, leave Dorking by the Guildford Road. In two miles comes Wootton and the famous Coast Hill—gradient, 1 in 12. Rather more than a mile from the top of this is a cross road, where the right branch rises about 100ft. to a bridge over the S.E.R. Then comes a bit of about 1 in 20, an "S" bend of 1 in 10 and a simply wicked "Devil's Elbow" on what cannot possibly be less than 1 in 5 or 6.

The hill, locally known as White Downs, goes on for quite another half-mile with gradients of about 1 in 10-15. The road is quite a decent one, and wonderfully pretty, but the surface, of course, on the hill itself is terrible, though I rode safely down it!

I should dearly like to see a hill-climbing contest here, and am quite willing to help organise one and give one of the prizes.

I had supper afterwards with some keen motor cyclists at Leatherhead who take on all the local "climbs," but have never faced this one. Come on, ye Sutton Bankers!

WILLIAM PERCY.

Hills and Hill-climbing.

[3390.]—I read with interest your account of the Sutton Bank hill-climb. Now, this particular hill I have ascended myself on a $3\frac{1}{4}$ Rex (1905), and I need not say I was ready for a rest after the exertion of the climb. I am sure it will be of interest to your readers to know that I can find hills hereabouts (Kirkby Stephen) much steeper than Sutton Bank. Quite recently I saw a 20 h.p. — try to negotiate one of the hills in question, and it failed even to get up on its reverse, with the result that the driver lit his lamps, left the car on the hill overnight, and returned next morning, only to be again beaten. I have lived in close proximity to this hill, and have never seen any single geared motor cycle yet go up it, having attempted it myself several times on various machines, including one with a two-speed gear, and then I had to dismount. I am sure it would be good training for motor cyclists to try some of the hills around this pretty part, and even if they do fail to negotiate them, I am sure the scenery will repay them for their trouble. All the hills I allude to are within four miles of ample accommodation.

It is rather amusing to read of "hill-climbs" in places where it bothers me to find what I call a rise, but even from geographical knowledge it is unquestionable that we find hills in the Lake District and the Pennines. As the place where I reside is practically unknown to thousands of the motor cycling community I trust you will allow this to circulate in your valuable pennyworth (worth a shilling a week for wrinkles alone) in the hope that a meet may take place at an early date in order to test the severity of the hills.

Should any of your numerous readers choose to "try conclusions" I shall be only too pleased to supply them with the names and locality of the hills near Kirkby Stephen, and I have also mapped out what I consider an ideal route for a reliability trial. I shall be happy to see as many attempts upon these hills as can be arranged in order that my statements may be tested.

NELSON HODGSON.

N.B.—Riders in the End-to-end should be careful of the police traps about Lancaster, Garstang, Kendal, Hackthorpe (two to three miles north of Shap), two to four miles north of Penrith, and one mile each side of Carlisle. Is there a checker required at Penrith for the A.C.U. trial?

Motor Cycle Racing at Brooklands.

[3391.]—Is there any hope that a motor cycle race will be held in the near future on the Brooklands Track? We may mention that we have just received from our works a specially built 8 h.p. path racer, which we are rather anxious to try on the Brooklands Track, and, therefore, you will understand that we are rather keen to do so on the occasion of the next race for motor cycles.

N.S.U. MOTOR CO., LTD.

[In consequence of a legal decision against the proprietor of the track, the officials are desirous of preventing all unnecessary noise. They consider racing motor cycles make more noise than racing motor cars, and for the present they have stopped all motor cycle races on Brooklands.—Ed.]

A Problem to be Solved.

[3392.]—As a rider of a $4\frac{1}{2}$ h.p. four-cylinder F.N., I was much interested to read Mr. Ovington's letter in the issue of June 17th. I have myself experienced exactly the phenomenon described by your correspondent, and am completely at a loss to understand it.

I cannot altogether agree with Mr. Ovington that the expansion of the piston combined with excessive lubrication is responsible for the greater power, as I think it is improbable that the piston expands very much more than the cylinder.

Last week-end I rode over to breakfast with some friends fifty-four miles away, and at that hour of the day the air was very chilly. Notwithstanding the coldness of the air, I managed to get my engine running in this abnormal way several times, so that I did the journey in two hours. Coming back in the late afternoon, when it was very hot, I was completely unable to produce this condition at all, though the engine must have been much hotter. This does not agree with Mr. Ovington's theory, which is founded on the heating of the engine.

I should be glad to see any solution of this puzzle which may occur to any of your readers. N. RAMSAY.

[3393.]—I was very interested when reading Mr. E. L. Ovington's letter [No. 3364] concerning his four-cylinder F.N., as I have had precisely the same experience with mine. I was very surprised to see that he had experienced this "abnormal" state only some six or eight times in three years' running. Personally, I can get into the abnormal state whenever I like, after going some five miles. I attribute this to a very accurate adjustment of the carburetter. I noticed the abnormal state first after some 1,500 miles running, and then had the carburetter adjusted. Then I noticed that I could get into the abnormal state without having the throttle full open, as was necessary at first. And now, after some 3,500 miles running, I can get the abnormal state with the throttle only three notches open; consequently, I can get some 95 to 100 miles out of a gallon of petrol. I differ from Mr. Ovington as regards lubrication, for I give a pumpful every ten miles, and that is very often more than sufficient. I think if Mr. Ovington had his needle valve adjusted very accurately he would get the same results as I have. I should like to know whether any other riders of the four-cylinder F.N. have ever had this experience. H. HILL.

[3394.]—The interesting letter of Mr. E. L. Ovington presents a problem which at first sight seems very surprising. It admits, however, of a very simple explanation.

It will, I think, be granted that, provided an engine is in sound condition, and, even when freely lubricated, the oil does not get past the piston rings, free lubrication produces a better compression—e.g., a cylinder which has a complete film of oil between its wall and the piston will give a better compression than one in which the film is intermittent or incomplete.

Now it is possible that the case Mr. Ovington presents is the same as the above for the following reasons. The data of his formula are as follows:

1. F.N. four-cylinder.
2. Copious lubrication.
3. A slight down grade, taken at high speed.
4. An increase of speed above a normal maximum, continuing for a few miles only.

Now, the crank case of the four-cylinder F.N. is, I believe, divided into two compartments, one behind the other, and has a separate oil duct to each.

The F.N. engine, when both wheels are on the ground, inclines rearwards. This inclination causes the oil to be

Fig. 1.—When machine is on level ground or pointing up hill.

A B, line of lowest point of stroke.
C D, oil levels.

deeper just forward of the centre partition and at the rear end of the crank case, and therefore the cylinders which get most lubricated are the second from the front and the rear one, since the connecting rods of these cylinders plunge further into the oil. I think the drawings will explain. The inclination is, of course, exaggerated.

When Mr. Ovington starts lubricating very freely, provided that none of that lubricant gets above the piston, he must improve the compression of his engine; but he does not improve it uniformly until he begins to go down a slight incline, when the oil rises higher in the forward ends of the crank case partitions than the rearward ends, and consequently the cylinders 1 and 3,

Fig. 2.—When machine is pointing down hill.

which were less lubricated than 2 and 4, now become equally lubricated with them, solely owing to the altered level of the oil in relation to the crank case. The nett result is that the compression in cylinders 1 and 3 is improved, and thus the firing

efficiency of the engine is increased, the high speed naturally improving the lubrication.

This explanation tallies with the sequel. After a few miles the speed falls off—i.e., after the oil has sunk to its original level, and the film in cylinders 1 and 3 has become imperfect, the compression in those cylinders deteriorates, and the engine returns to its lower efficiency.

Probably the result is not noticeable in the following cases for the annexed reasons:

1. Down a slight descent followed by a rise. Because the oil film has not had time to form before the position of the crank case is reversed; or because, if the oil film has formed, the strengthened compression does not suit the engine on a rise, where a lower compression is (by theory and convention) more beneficial.

2. Down a steep grade. Because then the crank case gets tilted forward so as to rob cylinders 2 and 4 of their film and compression.

Lastly, the high temperature at which Mr. Ovington's engine was working, if it had any effect, would merely accentuate the effect of the higher compression.

Only those who have shed metaphorical tears and metaphorical language by deserted roadsides over the lapses of lubricant can ever truly realise the extraordinary sensitiveness of a well-made engine to deficiency or excess of lubricant. The F.N. advice is, "Graissez peu, mais souvent," and it is the best of all except one, and that is, "have automatic lubrication," and if you have more than one cylinder, see they are all lubricated equally. It makes all the difference between a "first and fastest time" and an "also ran."

The above explanation may seem too slender and subtle to produce such a marked effect, but I am by no means alone in believing it to be the true solution of the problem; at any rate, it is a very simple one. I am sure we all welcome Mr. Ovington's letter, and look forward to more from his side of the water.

JOHN F. H. TEMPLER.

EXPERIENCES WANTED.

"J. A. G." would like best route from Plymouth to Rhayader.

"B. G." (Sheffield) would like readers' experiences of the $3\frac{1}{2}$ h.p. Raleighette tricar. How many miles an hour will it accomplish? what gradients will it climb? is it reliable?

"A. R. R." (Mayford) would like readers' experiences of Elastes filled motor cycle tyres, particularly with regard to resiliency, weight, and whether it is possible to employ a smaller section cover with Elastes than with air.

(Several letters are held over.)

Telephone: 2173 Victoria. Telegrams: "Elastesque, London."

Obtainable at all Dunlop Depots and Motor Agents everywhere.

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Liffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

MOTOR BICYCLES FOR SALE.

HALIFAX.—Lightweights, in going order, 25s. deposit and six monthly payments of 22s. 6d. secures 1½ h.p. Minerva, 2 h.p. Minerva, 2 h.p. Kelecom, 2 h.p. Humber, 2 h.p. Universal, 2 h.p. Princeps, 2 h.p. magneto Simms, 2½ h.p. magneto chain drive Singer.

The PREMIER

WORKS AND SHOWROOMS

are the Largest in the World devoted to Motor Cycles.

The latest designs of all the most popular makes may always be seen there—a sort of perpetual Stanley Show. Send full particulars of any second-hand machine you may wish to exchange for a new one, and you will promptly receive a liberal offer. We can make very early delivery of 1908 TRIUMPHS.

All the SHOP-SOILED and SECOND-HAND MACHINES on the following list are cheap. Some of them are simply wonderful bargains. They are absolutely reliable, and covered by the Premier certificate of fitness. Take advantage of "The Motor Cycle" deposit system, and have one on approval.

ADVERTISERS — Please note
that Friday is the latest day we
can receive advertisement copy
for this following week's issue.

ENGINES.

BOOTH.—Twin Antoine, new, £8 5s.; 5 h.p. water-cooled Antoine, new, £8 5s.; 6 h.p. Avon, water-cooled, M.O.V., £6 5s.

BOOTH.—2½ h.p. Noble, £3 5s.; 2½ h.p. Jap, £3 5s.; 2½ h.p. Noble, £2 2s. 6d.; 3 h.p. Rex, £3 5s.; 1½ h.p. Minerva set, tank, etc.; £3.

BOOTH.—Other engines taken in exchange. —Booth's Motor Exchange, Wade Street, Halifax.

4-5 h.p. W.C. Head, very powerful; £4 10s., or 2½ h.p. and cash.—50, Victoria Road, Stroud Green.

5-6 h.p. Twin Antoine Engine, condition like new, complete, with silencer and spares; £5 10s.—18, Wellington Road, Smethwick.

DE DION (genuine) 3½ h.p. water-cooled engine, with carburetter, etc.; £7 12s.; suitable for driving a dynamo.—H. Pouncer, 169, Mayall Road, Brixton.

MANCHESTER.—5 h.p. engine, complete, with Longuemare carburetter, suit tri-car, £5, bargain; also four accumulators at 6s. 6d. each.—A. Burton, 158, Chorlton Road, Manchester.

TYRES.

PAIR Continental Covers, wired, 26 by 2½, as new; 15s. the pair.—Varney, 40, Angel Lane, Stratford.

MOTOR Cycle Covers, re-treaded, like new; 11s. 6d.—Ardea Company, 331a, King Street, Hammersmith.

DUNLOP Covers, 28 by 2½, beaded, new; 18s.; cash with order.—Smith, 16, Summerhill Terrace, Birmingham.

PAIR New 26 by 2 Continental Covers, beaded; 13s. 11d. each.—Robson, 30, St. John's Road, New Sheldon, Durham.

EXTRA Heavy Clincher and Tube, 26 by 2, beaded, unused; cost 35s., sell 21s.—M., Kingslea, Weston Park, Thames Ditton.

MAUDE'S—Fully guaranteed tubes, 26 by 2, 2in., 6s.; 2½in., 7s.; 2½in., 8s.; 28 by 2, 7s.; 2½, 7s. 6d.; 2½in., 8s.; approval willingly.

MAUDE'S—Covers, 26 by 2in., 16s.; 2½, 17s. 6d.; 28 by 2in., 17s.; 2½in., 18s.—Maude's, Powell Street, Halifax.

CLINCHER A Won Brand New Covers, 26 by 2, 19s. 6d.; 26 by 2½, 21s.; also extra heavy 26 by 2 ditto, 21s.; order at once; only a limited quantity; prices are below usual trade prices; approval.—Lomax Tyre Co., Great Charles Street, Birmingham.

50 Per Cent. off usual prices.—Clincher A Won brand new covers, 26 by 2, 18s. 6d.; 26 by 2½, £1; 28 by 2½, heavy tri-car, 23s.; 26 by 2, extra heavy, 21s.; 26 by 2½, extra heavy, 22s.; all ribbed non-skid treads.—Farrar.

CLINCHERS.—Special 2½in. covers, to fit 2in. or 2½in. rims, 25s. each; don't be under-tyred. It's false economy.—Farrar.

SPECIAL Line.—Clincher tubes, 26 by 2, and 28 by 2, complete with valves; 5s. each, post free.—Farrar.

10s. allowed for old covers in exchange for Goodrich, Palmers, Shamrocks.—Farrar, Square Road, Halifax.

28 by 2 Light Dunlop, nearly new, 8s.; 26 by 2½ Palmer, 8s.; 26 by 2½ Dunlop, 6s.; pair 26 by 2, with rims, 10s.—50, Victoria Road, Stroud Green.

TWO Motor Cycle Covers, 26 by 2 (brand new), never used, beaded edge; accept half usual cost, 12s. each.—Motorist, 26, Offerton Lane, Stockport.

26 by 2½ Peter-Union studded tyre, unused since re-treaded, one Rich and Peter-Union butt-ended tube; cheap for immediate sale.—Apply, Bradstock, Harpford, Ottery St. Mary, Devon.

MOTOR Cycle Covers at wholesale prices.—Heavy quality, 26 by 2, 2½, and 2½, 11s. 6d. each; 28 by 2, 2½, and 2½, 12s. 6d. each; beaded edge 1s. 6d. extra.—Universal Motor Tyre Co., 35 and 37, Chestergate, Stockport.

HALIFAX.—Brand new inner tubes, best make, 26 by 2, 6s. 6d.; 26 by 2½, 7s.; 28 by 2, 7s.; 28 by 2½, 7s. 6d.; 28 by 2½, 8s. 6d.; genuine Calmon covers, fit Palmer rims, with non-slipping tread, 26 by 2½, 15s. 9d.; 28 by 2, 15s. 9d.; 28 by 2½, 16s. 9d.; 28 by 2½, 20s. 6d.; all beaded edge.—Halifax Motor Exchange, Westgate, Halifax.

TYRES.

BOOTH.—New rubber studded cover, 26 by 2, 25s.; ditto, 26 by 2½, 27s. 6d.

BOOTH.—Peter-Unions, 24 by 2½, 28 by 2½, 15s. 6d.; Royalty covers, 26 by 2, 12s. 6d.; 2½, 13s. 6d.

BOOTH.—Ten shillings allowed for old cover in exchange for Shamrocks, Palmers, Goodrich's.

BOOTH.—Tyres, best make, 26 by 2, 16s.; 2½, 17s. 6d.; 2½, 21s.; 28 by 2, 16s. 6d.

BOOTH.—Best tubes, 26 by 2, 7s.; 2½, 7s. 6d.; 2½in., 8s. 6d.; 28 by 2, 7s. 6d.

BOOTH.—All tyres sent on approval.—Booth's Motor Exchange, Wade Street, Halifax.

COVERS.—Strong beaded, ribbed tread, 26 by 2, 17s.; 26 by 2½, 18s.; 26 by 2½, 19s. 6d.; 28 by 2, 18s. 6d.; carriage paid.—Below.

S. Allowed for your old cover in exchange for genuine Continentals.—Para Rubber Co., 93, John Bright Street, Birmingham.

CLINCHER A Won, new and perfect, 26 by 2½, 18s.; extra heavy, 22s.; 28 by 2½, 21s.; 28 by 2½, 23s.; inner tubes, valved, 28 by 2, 4s. 6d.; 2½, 6s.; 26 by 2½, 6s. 6d.; all guaranteed Clinchers.—Oakleys, Aston Street, Birmingham.

REPAIRERS.

£5 any motor cycle we cannot repair.—Whites, 22, Brookes Street, Church Street, Liverpool.

£5 any motor cycle we cannot repair.—Whites, 22, Brook's Alley, Church Street, Liverpool.

WERNERS, Werners.—Beard Bros., Cricklewood, undertake all repairs and replacements. Sole concessionnaires.

BEARD Bros., specialists in Werner motors. Sole concessionnaires. Repairs undertaken.—Cricklewood Broadway.

CRACKED Water Jackets of motors successfully repaired by Lea's metallurgical process.—Lea and Son, engineers, Runcorn.

GRIFFIN and Sleat, Eastbourne.—Cylinders re-bored and new pistons fitted, or engine completely overhauled; let us quote you.

BIRMINGHAM.—Repairs and overhauling: accumulators charged and repaired; prompt attention; moderate charges.—Priest and Williams, 66, Bishop Street.

LEICESTER and County Riders should look up the Central Motor Co., Langton Street, Belgrave Gate, Leicester, for repairs, tyres, accessories, and accumulator charging.

CCCCCCCC Compression means power.—Cylinders re-bored and new pistons fitted; guaranteed fit 4-1,000in.; bears 13 stone on pedal; write for list.—Gradior Machine Co., Compression Specialists, Stafford.

TO West of England Motorists.—Car and motor cycle repairs, prompt and reliable; cylinders re-bored, new pistons and rings fitted; don't hesitate; send straight to us.—Hamlin, Motor Works, Bridgwater.

CHEAP and Practical Repairs to motor cycles, cylinders re-bored, new pistons fitted, accumulators charged and repaired, vulcanising of every description.—Campbell, 156, Wirtemberg Street, Clapham, S.W.

10 Years' Experience means efficiency and economy for customers; De Dion, M.M.C., Excelsior, and motor cycle experts; large stock of renewals; repairs prompt; power increased by larger cylinder bore.—The Record Motor Co., Coventry.

REPAIRS and Overhauling.—We have the finest repair works in London for motor cycles, with up-to-date machinery—estimates free; new cylinders for any make of engine, pulleys, valves, gears, and all replacements; send for our new booklets, with prices.—Laystall Motor Engineering Works, 27 and 29, Laystall Street, Rosebery Avenue, E.C.

EXCHANGE.

33 h.p. Excelsior, Palmers, non-skid; cash, or exchange.—45, Infirmary Road, Sheffield.

6 h.p. Decauville Car, good order, for motor cycle, or sell.—33b, Grand Parade, Harringay.

COMPRESSION

Cylinders Rebored

and new Pistons fitted complete with Rings and Gudgeon Pin.

Compression means Power.

EXCHANGE.

19⁰⁶ Twin Rex, grand order, for 3½ h.p. good make, and cash.—Below.

2 h.p. Peugeot, new covers, long bar, low seat, for 3½in. Drummond lathe.

19⁰⁶ Twin Rex, fitted Osborne gear and sidecar, takes two and a boy anywhere, cash.

12 h.p. Engine Set and Cycle, only want fitting up, for good phonograph and records.

SMITH'S Bellows, two air guns, for second-hand sewing machines, for anything useful.—Daborn, Windsor Road, Chobham, Woking.

GIVE Lady-back Tandem and cash for h.p. cheap motor bicycle.—114, Rutland Street, Stepney.

MILLS-FULFORD Motor Trailer, for lady or gent's cycle.—11, High Baxter Street, Bury St. Edmunds.

CAMERA, half-plate, folding, good, for two speed gear, or speed pulley.—58, Trenham Street, Wandsworth.

4 h.p. Water-cooled Cylinder and Piston for Simms-Bosch magneto.—24, Heathfield Road, Handsworth, Staffs.

EXCHANGE 5 h.p. Auto Motor Tricar, running order, for single and cash.—Hoyles, 12, Crossley Street, Halifax.

12 GUINEAS.—Rex, surface, clock-like regularity; wanted, typewriter.—Briggs, Milton Avenue, Bath.

EXCHANGE, Tricar, 3½ h.p. De Dion engine, for motor cycle and cash.—Tollands, Oakleigh Park, London, N.

5-6 h.p. Antoine Twin, grand condition, exchange for 2½ h.p. (or cycle) and cash. See Siddall, sales column.

EXCHANGE 2½ h.p. F.N., good condition, and cash for light, low, magneto cycle.—443, Green Lanes, Harringay Park.

BROOKS Bucket Seat, for H.F. vulcaniser, or buy for cash, also 750 by 80 tubes. Death, Beach Road W., Felixstowe.

GEAR Box, new, three speeds, reverse, cost £25; exchange up-to-date cycle, h.p.—42, Pershore Street, Birmingham.

TWO Motor Cycles, 3½ h.p. Rex, 3½ h.p. Ixion, both perfect and complete, for tricar.—30, London Road, Blackburn.

EXCHANGE, Lady's Cycle (Singer's Challenge), for good sidecar.—Shepherd, Helmsley Terrace, London Fields, N.E.

WANTED, Your Present Mount in payment of any 1908 make; keen quotations.—Farrar, Square Road, Halifax.

EXCHANGE Motor Cycle, Fafnir motor, Chater-Lea frame, for motor, suitable for boat.—10, Lindrum Road, Hampton Wick.

FINE Twin Rex for £4 and 1907 3½ h.p. Rex, or level exchange for 1907 3½ h.p. magneto Rex.—Motor Exchange, Westgate, Halifax.

MOTO-REVES, 1908 models, immediate delivery; second-hand motor cycle taken part exchange.—Crisswell's Garage, Newmarket.

51-6 h.p. Beeston Humberette, in splendid condition, for good make motor cycle with two speeds and cash.—J. Baker, H. well, Beaworthy.

EXCHANGE Pair Tyres, 870 by 90, pair by 2 wheels, pair 28 by 2½ air tube wanted, motor bike.—Gamble, 111, Humberstone Road, Leicester.

MOTOSACOCES, 1908 models; second-hand motor cycles, foreign and British stamps taken in part exchange.—Motors, Green Street, Cambridge.

EXCHANGE, splendid 10-12 h.p. two-cylinder two-seated Cottareau car for triumph or other good make cycle, or tricar and cash.—9, Newbould Road, Cheadle.

GIVING Up.—3½ h.p. Fafnir, Chater-Lea Longuemare, two accumulators, studded back tyre, lamp, horn, stand, too registered, three tubes; £18, or three-speed push cycle and cash.—Fielding, St. George's Square, Hebden Bridge.

303 Sporting Lee-Metford Magazine Rifle, cost £10, perfectly new condition, and 300 rook rifle, for Montgomery sidecar or sell £6; approval; also Goodlad's speedometer for separate generator.—Marksmen, 2, The Parade, Camberley.

The End-to-End Trial.

BY the time this issue is in the hands of most of our readers the End-to-end trial—the most important of all motor cycle competitions—will be very close at hand. This year the entries fall about twenty short of the number taking part in the trial of two years ago, but the falling off is not quite so serious as it seems to be. Nearly all the entries this year are from motor bicyclists, while the number of passenger carrying machines is exceedingly small. Two years ago, however, the last mentioned type of motor cycle was much better represented.

The entries received this year amount to rather over sixty in number, and there seems to be no doubt that all enter with the intention of making a good fight to reach the finish. Last week Mr. B. H. Davies told intending competitors how to tune up their machines for the ordeal; the men, on the other hand, have doubtless been getting themselves into training by taking long rides and getting themselves fit. Not a few have been over the route before, so that everyone appears to have a chance of reaching the house that John founded, but did not build. There is, however, one small but important item to be considered, and that is the element of luck, which competitors and officials all strive hard to eliminate, and that it can be eliminated to a very large extent we are quite confident. By careful overhauling, defective parts in a machine can be discovered and replaced, by careful training the evil effects of over-exertion and fatigue can be overcome, but bad luck or, as Horace of old called it, "atra cura" sits behind the motor cyclist even as it did behind the horseman of olden times. Of the presence of this ill-omened demon no one who has religiously followed and studied six consecutive

A.C.U. trials can fail to be aware. One has only to refer to the reports of these competitions and see the number of good men and true who have been thrown out of a trial through an accident.

Accidents are really not all due to bad luck; generally speaking, someone is to blame, and this leads one to infer that carelessness plays no small part in the numerous mishaps which the writer is so reluctant to have to relate in writing his reports. With himself fit and his machine in good fettle a man has every chance of getting through, but his work does not cease there. He must all the time strive to maintain the machine and himself in that good condition in which both started, and the way to do this is to drive carefully. The A.C.U. officials are taking every possible step to cause competitors to drive with due consideration through towns and to keep their speed down in populous places, as by doing so they save the riders unnecessary fatigue, they save their machines, and endeavour to protect the public and save them from receiving anything but a good impression of the trials. The driving clause was primarily drawn up with the object of pleasing the public and the police, but above we have endeavoured to show that it is to the competitor's own interests to obey the rule. John-o'-Groat's is well worth reaching. Few people will ever see the place, so that those who have the opportunity should appropriate as their motto, "Take no risks." Tearing round blind corners, rushing down steep hills, and driving fast through towns are signs of bad form, and if indulged in, greatly lessen a competitor's chance of getting through. In conclusion we trust that these few hints will be observed, and, having expressed our views, we wish the best of luck to all those taking part in the contest.

Through Many Lands by Motor Cycle.

By E. M. BAXTER.

(Continued from page 515.)

Gaining Confidence.

About a fortnight was given to the gaining of experience in the driving of the new machine, and in studying its peculiarities and limitations. To this end daily excursions up to three or four score miles were made on all the chief

roads north and west of London. A very close watch was kept on every part of the engine and magneto, and the belt was tested under different degrees of tension. Various classes of both engine oil and petrol were experimented with for the purpose of trying to determine which would give the best results under the writer's driving. Paraffin and several alcoholic mixtures (not beverages) were also tried as fuel, so that there would be some personal experimental knowledge available in case a time should come when no customary fuel could be procured.

A sooted sparking plug and a visible surplus of oil in the engine at the end of two or three days was evidence that a full charge of oil every twenty or twenty-two miles is too much in the writer's case on an average speed of no more than *twelve* miles an hour. Ultimately the tests seemed to indicate that the greater the work required of the engine the more oil it is advisable to inject. When the rate is ten or twelve miles an hour on easy roads the quantity of oil used is a full charge every thirty miles, but when the average speed lies between twenty and twenty-five miles an hour, the road being smooth and not very hilly, the best results are obtained with a full charge of oil every twenty-five miles. Running at high speed on hilly and otherwise hard roads requires a charge of oil every twenty-two miles, and just before taking a severe hill it is found advantageous to give about a fifth of a charge of oil, unless a full fresh charge has been injected within a few minutes. One brand of petrol was thought to give rather more power than any of the others tried, but even this did not seem to be quite uniform in its results. It was found possible to use, at a pinch, lamp petrol or any one of several strong spirits in place of the usual fuel, but the effects of these on the engine by use for a number of hours or days could not, of course, be determined.

Another deduction from the experimental fortnight was that for such a tour as that in prospect a considerably larger tank would be advisable. Moreover, it was thought best to provide additional luggage space for the purpose of carrying a fair supply of "spares," a photographic outfit, and the small personal kit of the rider.

With the conclusion of the experimental study of the machine, and the change of tank, all was ready

for the definite start on the tour which seemed likely to extend through the greater part of the year, and lead into many delightful nooks in many strange lands. "Weighing in," it was found that the gross load to be propelled by the sturdy little $3\frac{1}{2}$ h.p. engine was some four hundred and fifteen pounds, or about thirty stones. Thus heavily loaded the discovery was soon made that the centre of gravity of the machine is raised several inches higher than it is on the machine which carries only a lightweight rider. On good roads in good weather this difference is hardly noticeable, but when roads are rough or muddy the raising of the centre of gravity increases very materially the liability to side-slip.

A Discovery.

Shortly after learning that the high heavy load lessens the ease of maintaining the equilibrium of the motor cycle on bad roads a counter discovery was accidentally made. By swinging the feet just clear of the ground one is readily able to check any tendency to fall, and thus keep going on instead of falling down. This "trick," undoubtedly known to all experienced motor cyclists, has saved the writer from a number of falls, let him down gently in several cases, and enabled him to run on very bad sections of road, whereas he would otherwise have had to dismount and push. Some Continental motor cyclists apparently did not know this "dodge." At any rate, several expressed surprise and admiration at its simple effectiveness.

A number of days were spent touring in the southern English counties before the Channel was crossed. Hardly a yard of the route traversed was dry, although in some places the "grease" was becoming stiff from the action of the wind, and thus was more annoying than when in a softer state. On several occasions the rider was caught in pelting rains, and once in a very severe but short hailstorm. At these times no external part of the cycle was free from the beating waters, and the thin mud of the road picked up by the quickly turning wheels continuously trickled off the machine. But the engine sang away sweetly, the magneto was unconscious of the raging elements, and the cycle splashed steadily on. Neither the weather nor the roads offered any obstacle to my mount. Up the heaviest grades—and there are some "stiff" hills in this part of the country—the speed fell off, but there was never a failure. On, on we kept going, sometimes with Boreas battling bravely to stop our advance, yet recovering speed easily after the more difficult parts of the steepest rises were surmounted. Occasionally the sun glanced slyly at the humid earth, and along the coast chill mists rolled in dense and dark from the murmuring waters of the deep.

Not a touring motor cyclist was seen with the exception of some few men on business bent at Bristol, Southampton, Brighton, and other large towns.

Through Many Lands by Motor Cycle.—

Hostelries in general in midland and southern England "love" motor cyclists much as the farmer loves the lamb—for the prospective fleece. With scarce an exception they look upon the motor cycle as a badge of affluence. Let this be accompanied by the American accent, so-called, which, by the way, seems to be the twin sister of cultured English speech. This reminds us of the New York lady who said when discussing a university graduate that he was a nice boy, but spoke with such a terrible English accent.—ED.], and "mine host" plainly lets it be seen that he anticipates liberal commands, for which a suitable price will be charged on the forthcoming bill. If the motor cyclist is modestly economical he is efficiently given to understand that he is hardly a credit to the reputation and traditions of the worthy house, which may be reputed to have entertained in the past a prince, a pretender, or even a monarch. To-day capital is made of the glorious personages and follies of bygone centuries, the innocent traveller being required to pay out good coin of the realm on account of the ghostly forms which legend's ever truthful tongue says are looking with kindly eyes on his presence. Whispering awe and genuflecting reverence are chattels of some value.

But not every English innkeeper wears the livery pictured above. Some there are whose accommodations and charges are fair, and independent of any

venerable shades that may haunt their abodes. In any case, however, English hotel charges are high, possibly on account of the huge national debt and the inordinate cost of producing the necessaries of living. At any rate, these or other causes are very apparent in the bills of the tourist who travels by motor cycle. This is the experience of a foreigner. It is quite likely that an Englishman can travel more economically and with more satisfaction than the alien, because he is conversant with the customs of the country.

Modest cottage and noble hall, mead and wold, hill and valley, have ever enduring charms which give interest to the constantly varying pictures of nature that are passed in review by the motor cyclist. Even vile weather and grasping hosts cannot take away the delights of the English countryside—the countryside as seen by him who looks not for the relation between it and those who dwell therein. Even at a season when the prevailing tones are greys and browns and purples no country in the world is quite so attractive in its combined sylvan and pastoral scenes as England. What pleasing mutations of form and combinations of colour! But even these must not detain the tourist too long.

Folkestone was set in banks of mist, the Channel was veiled in fleecy vapours, and Boulogne was bathed in the tears of the weeping skies, as we prepared to embark for other shores.

(To be continued. See announcement last week, page 514.)

THE COWEY SPEED INDICATOR.

YET another firm which is seriously taking up the question of catering for motor cyclists as far as speed indicators are concerned is the Cowey Engineering Co., Ltd., 1, Albemarle Street, Piccadilly, W. The speed indicator has its dial fixed on the handle-bar, the transmission being effected by

On the left the dial showing the Odometer, and on the right the driving pinion bracket and flexible shafting.

means of spur wheels. The driving spur wheel is attached to a bracket designed to clip on the front wheel spindle, while the transmission is conveyed to the mechanism by means of a protected flexible shaft. The principle employed in the instrument mainly consists of three fundamental parts—a heavy balance wheel, a spring, and a propelling device. The spring is connected up to the balance wheel by means of a small chain in such a manner that it tends to draw the balance wheel continuously in one direction (the direction of zero on the indicator), while the propelling device gives a series of intermittent impulses to the

wheel which tends to draw it in the opposite direction. The faster the machine travels the more numerous will be the impulses given to the balance wheel by the propelling device, and the spring, having more work to do in overcoming the effect of these impulses, will be deflected and allow the balance wheel to be displaced angularly to a greater or less extent. The balance wheel in its turn operates the indicator hand, and moves it into a position which represents the speed at which the motor cycle is travelling. One of the greatest features of the indicator is the steadiness of the hand under any conditions. The flexible shaft, instead of being a coiled wire, is a special form of chain. Every machine sold by the Cowey Engineering Co. is guaranteed to keep in perfect working order for twelve months, irrespective of the distance the machine has travelled. The dial is 2 3/4 in. in diameter, and the figures are clearly marked. An Odometer is also attached, which registers up to 10,000 miles.

Reference has been made in these columns to petrol spraying out of the vent hole in the filler cap of motor cycle tanks, especially when the tank is full. A reader reminds us of an old cure, *i.e.*, put a pin in the hole and bend the point upwards to prevent the pin getting lost.

The Bosch Magneto Co., Ltd., 23, Store Street, Tottenham Court Road, W.C., advise us that they are now in a position to furnish booklets descriptive of the D.A.V. magneto for twin-cylinder V engines for motor cycles. There has been a slight delay in completing these booklets, but any reader can have one now on application to the company at the above address.

Some of the Entrants for next week's End-to-end Trial.

LETTERS TO THE EDITOR.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20 Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Delay in Supplying Accessories.

[3395.]—The letter of Mr. Alexander Roger in your issue of June 3rd is very much to the point. I have myself been kept waiting respectively two weeks and three weeks for an acetylene headlight and generator, also ten days for side lamps and tail ditto. The headlight and generator were paid for cash in advance. The lamps mentioned were for a small car—8 h.p. Phoenix. LB 4558.

Suggested Meet of Motor Cyclists near London.

[3396.]—I have often thought, with the influence of your journal, a meet of motor cyclists could be arranged in or near London. A similar thing has been very successful in the Northern district, and I do not see why it could not be arranged with London and district clubs, say a point twelve to twenty miles from London—Hampton Court, Virginia Water, or any other appropriate place which could easily be arranged.

I should be very pleased to hear from other London and district clubs, with a view of carrying this into operation.

H. VOWLER,

Captain Western District Motor Club.

Leaking Batteries.

[3397.]—Along with hundreds of other motor cyclists, I experience much trouble from spilt acid. In almost every instance the leakage occurs past the terminal plugs—a fault which, to the lay mind, appears most easy to remedy by fixing a bridge at the top of the plates to stop all upward movement when running, and preventing the case from cutting the rubber stops at terminals.

Some makers put on the market a non-spilling battery, which the lucky possessors appreciate, but it is after a few months' use the trouble begins, and not everyone cares to scrap an accumulator which is in every other way perfect.

My object in writing is the hope that this wail may catch the eye of some of the makers, and induce them to adopt a means in future of preventing the prevailing grievance.

Not all manufacturers are motorists; if they were, the fact would soon become apparent that the jolting of a motor necessitates quite secure fixing of plates, whereas the general run of batteries are only good for stationary work.

R. N. MORLEY.

Sidecars and 3½ h.p. Machines.

[3398.]—Referring to your article on the above in your issue of the 24th ult., I wish to endorse the statements made as to the utility of a sidecar attached to a reliable 3½ h.p. machine. I purchased last month a 1908 Triumph 84 mm. × 86 mm. and a Milford castor wheel sidecar. I have covered about 600 miles without a hitch (except a puncture), and while I do not wish to enter into a discussion as to the merits and demerits of the different makes of sidecar, I have yet to find out the demerits of the castor wheel. I can thoroughly recommend this combination to anyone thinking of taking up motor cycling. The initial cost is much less, and the cost of upkeep only a fraction of that of a small car.

A recent week-end I invited a friend to go with me round the Antrim Coast. He was amused at the confident way in which I mapped out the route (160 miles), and looked on the prospective journey as a serious undertaking, but after the comfort of a well-sprung seat, the consistent running of the engine, and the average speed of eighteen miles per hour (our only involuntary stop being to repair a puncture), he is now enthusiastic over the trip and will soon be in possession of a similar machine.

J. W. C. COULTER.

Rubber v. Leather Belts.

[3399.]—The drawback *re* rubber belts of slipping when wet is certainly existent. The question is, does the slipping occur on the engine or the rim pulley?

The real drawback, of course, with all belts of this type is that they suddenly cease work without the slightest warning. The fastener pulls through, and no matter if run tight or slack the thing occurs with exasperating frequency.

Why do not the Lincona or some other firm turn their attention to a leather and rubber belt; that is, a leather built-up belt with a rubber covering?

Short of this I have found nothing to touch the new Lincona four-ply belt with improved flat rivets. The life of this belt is surprising, and I am surprised that such an excellent belt is not advertised and more heard of.

DISTRIBUTER.

Glen Finnart Climbed by Two Motor Cyclists.

[3400.]—Some few months back you published a very interesting article entitled "By Mountain, Glen, and Loch," written by Mr. T. C. Maitland, which led to some correspondence in your columns between that gentleman, "Argyllshire," and Mr. Hugh Gibson, of Southport. This resulted in Mr. Gibson promising to attempt to climb Glen Finnart. This hill Mr. Maitland describes—and rightly, too—as most severe and dangerous; in fact, I must say, after seeing the hill, his description is a very true one.

On June 27th I accompanied Mr. Gibson to witness his promised attempt. After studying the hill, and walking up to examine the hairpin bends (four), we both came to the conclusion that it was an almost impossible hill in the course of a tour; in fact, quite so, without a two-speed gear, owing to the dangerous bends, terribly rough, broken surface, and severe gradients on the bends—quite one in four, I should say, although the average gradient is given as one in eight in the Contour Book. At the first attempt, Mr. Gibson succeeded in reaching the last bend almost at the summit, when he came to grief through skidding badly on the broken surface, rolling over into the gutter and bank on the roadside.

Otto H. Gross (Manchester M.C.), who completed the 100 miles run in "The Motor Cycle" Cup Competition without an involuntary stop.

Attempt No. 2 was similarly unsuccessful, and once more the twin Vindec and its rider skidded off the road (a misnomer—track would be a better description), and again came to grief. Both these falls shook Mr. Gibson badly, as he is a light rider, and, as you know, a twin Vindec is not a lightweight to handle. At the third attempt he succeeded in making a clean ascent, but with the low speed in on the last bend. His performance was most plucky and skilful, as many riders, I am sure, would have been disheartened.

Mr. Maitland and "Argyllshire," I think, will be interested to hear that I succeeded in climbing the hill on a 1908 $3\frac{1}{2}$ h.p. standard Triumph at first attempt. I attribute my success where Mr. Gibson failed on two occasions to the lighter weight and the easier control of my machine at the bends.

I am afraid I shall be accused of self-aggrandisement for mentioning my climb, but I have done so with the desire to show what a flexible engine is capable of in the hands of one who understands and can handle it successfully. At the same time, I certainly think a two-speed gear necessary, as I should describe this hill as unclimbable in the course of an ordinary tour. I believe Mr. Gibson's gears were $4\frac{1}{2}$ to 1 and 9 to 1, his weight 9 stones 3 lbs. My gear was $5\frac{1}{4}$ to 1, weight normal 11 stones. I cannot say what my weight was whilst riding the hill, as I discarded almost every possible article of clothing before making the attempt, knowing it would be necessary to pedal at the bends where I had to slow the engine.

J. H. BRERETON.

Piston Rings.

[3401.]—Possibly some of your readers who use small high speed engines and have had piston ring trouble may find the following of some interest.

I have a theory, based on experience, that engines of that type are more severe on their rings than those of a bigger slow speed pattern. Anyhow, I had much trouble with my rings till within a comparatively recent date. Breakages, loss of compression due to rapid wearing of rings, and ditto due to the slots getting into line when running, were constant worries. I tried various rings, including three different samples made by the firm responsible for the engine (a foreign house—one of the best known in the motor cycling world). All of these gave more or less indifferent results. In a happy hour I tried the Grador piston rings. Since then my troubles have vanished. These seem to have so much "substance" and "spring" in them as to offer probabilities of very prolonged wear and small chance of breakage. In addition to that, the makers have adopted the very simple and sensible plan of cutting the slot of the centrally placed ring in a direction the reverse of that in the upper and lower rings. This greatly lessens the risk of the slots getting into line—a trouble which was continually occurring with the rings originally fitted in my engine, and, of course, meant a falling off in compression. This falling off in compression was apparently most apt to show itself just at the time when it would be most felt, i.e., when tackling a steep up grade.

I have no financial interest, direct or indirect, in recommending the rings made by the Grador Co., but would like to let fellow motor cyclists know of the good thing I have discovered.

Other riders may be experiencing worries similar to mine. To them I would suggest the cure I have found so successful.

EXPERIENTIA DOCET.

Belt Fasteners.

[3402.]—Do "Ixion" and "O 693" ever read the advertisement columns of *The Motor Cycle*? Let them use their eyesight and save their money and tempers; a fastener to their own specification and better has been advertised there for about a year, made by S. T. Robson, of Birmingham. I have had one of his Star Patent on a $3\frac{1}{2}$ h.p. single for over 3,000 miles, and just lately examined it out of curiosity for the first time. It is practically as new, and should last out several belts (leather belts I mean, not 1,000 mile rubber things for the kid-gloved brigade). A friend of mine has had the same experience, and we agree that the maker deserves a testimonial and free advertisement, as he will not have many repeat orders.

JUPITER.

Mechanical Valves on Twin-cylinder Engines.

[3403.]—Why is it that nearly all manufacturers persist in using the old-fashioned automatic inlet valve in their twin motor cycles? Surely the superiority of the mechanical valve has been proved often enough to justify universal adoption. I happen to know several twin owners, and all complain of the continual tinkering with the inlet valve springs that is necessary. Again, there is the question of leaky domes, which I believe is a persistent form of worry in many twin engines. As far as I can see, there is absolutely no reason for retaining a.o.v. in twins. People seem to have agreed to abolish it in single-cylinders, therefore why not in twins? where it is really more necessary to have m.o.i.v., since it is so difficult to get the two automatic valve springs of equal strength. Is it possible that manufacturers are loth to lay aside their old patterns? Really, there seems to have been no improvement in two-cylinder engines during the last year or two. I hope some of the advocates of the antiquated notion of a.o.i.v. will set forth what they consider to be the advantages of the system, as I can see none at present.

As regards exhaust valves getting loose and breaking pistons, I may add another case, absolutely true. A friend of mine, when riding a $2\frac{1}{2}$ h.p. Clément-Garrard, had his piston smashed by the exhaust valve head while riding. There was certainly no doubt about it, as he had to make another piston! Fortunately, being a good mechanic, he did not have to buy another piston, as the average rider would have to do.

M.O.I.V.

Touring Machines. The Weight Question.

[3404.]—With reference to letter 3358 on the above subject from the Motor Rêve Co., it would appear from their

Competitors congregating at Tolka Bridge, Dublin, for the M.C.U.I. inter-centre contest for the Triumph Cup. (See page 541.)

remarks that they are under the impression I had never examined or tried one of their machines. As a matter of fact, the Motor Rêve was one of the machines I had in mind when the above article was written. I have no intention of decrying the lightweight machine at all, but the difference from the point of view of comfort and absence of vibration of my own heavy twin with the lightweight was very marked, and my machine is fitted with girder forks.

It appears to me that the whole question is based on the following points:

(1.) Tyres. The larger tyres of the heavier machine absorb road vibration to a greater extent than the smaller tyres of the lightweight.

(2.) A light machine is naturally banged and bumped about more than a heavy machine over rough roads, in the same way that a small single-cylinder car when compared with its big four or six-cylinder brother.

With regard to their remarks as to ease of control, I do not use an abnormally low gear, as they appear to think, and I had no word of complaint as to the ease of control of the lightweight, but simply drew attention to the fact that a heavy machine is not necessarily unmanageable in traffic as many appear to think.

I may add that the wheelbase of my machine is about 70in., very long handle-bars, footboards, and extra large saddle.

C. E. T.

A Problem to be Solved.

[3405.]—Referring to Mr. Templar's letter in your last issue *re* four-cylinder F.N., I should like to point out to him that my F.N. crank case is divided into four compartments. I do not know whether he has one or not, but his solution of the puzzle certainly fails so far as a four separate crank case engine is concerned. JOSEPH H. BROOKES.

[All four-cylinder F.N. engines have the crank case divided into four compartments.—ED.]

[3406.]—*Re* letter 3364, I have also noticed the same phenomenon on more than one motor cycle, though I cannot say that I have ridden more than a few yards with the engine in this condition; then it has suddenly lapsed into the normal state. No doubt it has occurred with others, but their belts may have slipped, causing their engines to race, and this they have attributed to the slipping of their belt, and thought no more about it. It is certain that belts will slip at the moment the engine takes such a powerful hold.

As regards the cause, I am of the same opinion as your correspondent; that is, that at a high temperature and speed there is a continuous film of oil between the expanded piston and cylinder on the upper side of each ring, and as it were riding on the rings. It is clear that when this is the case the compression will be the highest obtainable, as far as the piston is concerned; also the sides of the cylinder will be constantly and well lubricated, and thereby the highest efficiency obtained.

Trusting we shall have more information on the subject, as I consider it well worth ventilation,

FRED WHITTAKER.

[3407.]—Concerning our New York friend's unexplainable phenomenon, I believe that the lubricating oil acts as the fuel in a Diesel oil engine does, *i.e.*, it is squirted into the cylinder

Some competitors in the Leeds M.C.C. Hill Climb at Sutton Bank for the Grange Trophy, won by J. Scriven (5 h.p. Rex).

which is full of "red hot" air, and it burns and expands, forcing the piston down. In a Diesel engine the temperature of the cylinder is much above that of the ordinary cycle, so this I think explains it. This, though, leads me on to something else. Why should not Diesel engines be used for cycles? The advantages are: (1.) Oil burnt, not exploded; no silencer and even motion. (2.) Oil burnt in cylinder; no carburetter. (3.) It will burn any oil, and the temperature is so high that no deposit is left. The only disadvantage I can see is the fact that an air chamber for 750 lbs. of air is wanted and a small pump. SEMI-YANK, R.N.

[3408.]—I was extremely interested in the letter headed "A Problem to be Solved," by Earle L. Ovington, of New York, in *The Motor Cycle*.

I have now ridden a four-cylinder F.N. for three months, and have covered about 2,000 miles. My machine exhibits exactly the same phenomenon as Mr. Ovington so aptly described, only to a greater extent.

It will generally get into the "abnormal state" if the road is not uphill and the wind is also favourable.

I do not think it depends upon the heat of the engine so much as upon the warmth of the carburetter, which does not

get warm for a mile or two. Also I do not think that oil has much to do with it, as long as there is sufficient. I give one pumpful every twenty-five miles! If more is given, the inlet valves get "sticky," which I believe detrimental to the "abnormal state."

I consider my machine will go not more than thirty-five miles per hour normally, but will reach forty-five if not fifty miles per hour in the "abnormal state." When driving, I first get the machine into the "abnormal state," and then partly close the throttle, when it will still continue in this state, but at a reduced speed. I believe the secret of success partly lies in having the level of petrol very near the top of spray nozzle.

In conclusion, I must say that I have nothing but praise for the four-cylinder F.N. It is absolutely reliable, and will start at a walking pace. I have never had a single stop on the road as yet. It is a perfect boon to have no belt, and its consequent troubles. Its smooth running alone puts it streets ahead of all other makes. I shall always ride a four-cylinder F.N. if I can.

The prevalent idea that four cylinders make it complicated is a perfect fallacy. Any one cylinder can be removed in five minutes. I have never broken an exhaust valve!

B. H. BAYLISS.

Standard Machines in Competition.

[3409.]—With reference to the use of standard machines by the trade competitors in trials and hill-climbs, it may interest some of your readers to know that the 3½ h.p. Phelon and Moore, ridden by Mr. Moore in the A.C.U. Sutton Bank Hill-climb, was not only an absolutely standard machine, but also a very hard worked one. It competed with sidécar clips attached, and when the competition was over it was straightway connected up and set off for a week-end tour with passenger and sidecar. This is what I consider an all-round machine. How many machines that I saw at Sutton Bank could do the same?

T. P. CROSLAND, JUN.

[3410.]—Your leading article in *The Motor Cycle* of June 10th dealing with the above subject lays very necessary emphasis on a fact which the majority of your readers who have never witnessed an open hill-climb can hardly be expected to realise. For, despite occasional statements to the opposite effect, the trade man, with one or two notable exceptions, does most certainly ride a machine differing in all essential points from the standard model on which the prospective purchaser hopes to equal his feats.

Let me quote an instance with which I am personally acquainted, and which is typical of many others. A friend, who lives some two hundred miles from town, bought a 3½ h.p. machine of a well-known make emanating from the Continent, largely on the strength of the very remarkable performances made by a trade rider in charge of what he supposed to be an identical machine. Now, though by no means a "dud," this standard model was very far from being capable of the advertised powers of its supposed sister machine, and though sturdy and reliable for the most part, yet by no amount of care could the professional "tuner" have secured equal results therefrom, tune he never so wisely.

There are, of course (and I have frequently seen them), many more flagrant and deceptive examples of special construction than the one I have just referred to; still, it is no exaggeration to describe the difference in the present instance as lying between a frame fitted with an engine and an engine fitted with a frame—and a very slim one, too.

It must also be borne in mind that this use of one "advertising" machine cuts both ways, inasmuch as, while the purchaser does not get what he is led to expect, neither do the manufacturers gain that invaluable experience which accrues to those who enter their standard model, and who generally ride, not train, their bicycles to the scene of action, and display their powers perhaps on the very morning on which they have ridden down.

I will conclude by suggesting that not only should the machine itself be standard in all respects, even to tyres, but that ballast should always be employed to equalise riders' weights; and, further, that the rule relating to the use of effective silencers should be rigorously enforced.

H. LISTER COOPER.

EXPERIENCES WANTED.

"J. A. G." would like a reader to inform him of the best route from Plymouth to Rhayader, in Radnorshire.

CURRENT
CHAT.Special
FeaturesEND-TO-END ROUTE

List of Competitors and
their
Identification Numbers.

Gymkhana at Birmingham.

On Saturday, July 18th, the 13th annual gymkhana will be held at Birmingham in aid of the funds of the Moseley Hall Convalescent Hospital. Two open events for motor cycles will be included, viz., a slow race and a to and fro race.

Private Riders on Sutton Bank.

In the Leeds M.C.C. Sutton Bank Hill-climb at the end of last month we note in a letter from Fred C. Bagshaw that only five machines succeeded in reaching the summit of the hill, viz., three twin Rexes, a 9 h.p. Buchet racer, and a $3\frac{1}{2}$ h.p. Triumph.

Addresses Wanted.

Will Miss F. M. Crombie kindly communicate with us, as we have received a letter intended for her?

Will the correspondent who sent us particulars of the Laviassa Autocicletta, or the makers of this machine, kindly communicate with us, as we are anxious to know the exact address of the manufacturers?

More Unreliable Timing Methods.

Two Coventry motorists were summoned at Corwen last week for travelling at over twenty miles an hour. The solicitor who represented them succeeded in getting the case dismissed, as the four policemen who worked the trap admitted that they did not compare their watches either before or after trapping the motorists. The constables refused to estimate the speed at which the machines were travelling.

An American Competitor in the End-to-end.]

On Saturday last T. K. Hastings sailed from New York on the ss. St. Paul in order to ride in the Land's End to John-o'-Groat's trial next week. He will arrive at Plymouth and go direct to Penzance. The machine Mr. Hastings is bringing with him is a 5 h.p. twin-cylinder Indian, chain driven, and with magneto ignition.

Motor Cycle Race on the Continent.

The Motor Cycle Club of Rheims held last week the annual Grand Prix for motor bicycles of all classes over a circuit of eighteen miles, which was covered seven times. Eighteen competitors were started at one minute intervals, and the results were as follows: (1.) Dieudonne (Griffon), Michelin tyres, 3h. 20m. 45s.; (2.) Triquenot (René Gillet), 3h. 42m. 41s.; (3.) Noel (René Gillet), 3h. 47m. 50s.; Souplet (René Gillet), 3h. 59m. 52s.; and Lechanguette (Griffon), 4h. 16m. Bucquet had a fall in the fifth round, and unfortunately broke his right leg.

For the American Market.

Inventors of motor cycle specialities who are anxious to have these goods made on royalty in the United States should communicate with the Editor, marking their letters "Royalty," when they will be forwarded to the right quarter.

Dangerous Tramlines.

While riding through Kingston-on-Thames, the other day, a motor cyclist skidded on the tramlines at a corner, and was thrown to the ground. A local resident who witnessed the incident

Entente Cordiale. J. W. Percival's decorated triear at the Woodford meet, June 20th. The driver is attired as a French Army officer, and the passenger as Britannia

told the motor cyclist that the rails were regularly greased by the tramway company to prevent noise when cars are going round the corner. If such is the case a warning should be placed in a conspicuous position, as it is highly dangerous to cyclists and motor cyclists.

General Meeting of Motor Cyclists.

The suggestion is again made in our correspondence columns for a general meeting of motor cyclists in or near London. It is undoubtedly a good idea, and after the first gathering there would be no difficulty whatever in making the meeting a great success. Club secretaries should consider the matter.

Yarmouth Riders in the End-to-end.

Three members of the Yarmouth and District Motor Cycle Club will compete in the Six Days' Trial next week, viz., Dr. H. R. Mayo, F. G. Galley, and F. W. Barnes.

Damage caused by Steel-studded Tyres.

The Motor Union has received a letter from the Local Government Board's secretary in the following terms: "I am directed by the Local Government Board to state that it has been represented to them that much damage is done to the roads by the use of various forms of 'armoured' tyres on motor cars, and the suggestion has been made that such tyres should be prohibited."

Police Traps.

We are informed of a police trap working in the neighbourhood of Clitheroe, one mile from the town on the Skipton Road.

The trap at Southam (Warwickshire) resulted in a number of motorists being fined the sum of £60 in all last week.

A trap is in operation most week-ends in Lewisham High Road, S.E.

We are informed of the existence of a trap on Watling Street, electrically worked, at Weston-under-Lizard, running half-way between Penkridge and Wellington, Shropshire. The extent of the trap is 440 yards, and the road is dead straight.

In Barrack Road, Christchurch, on the Bournemouth Road, there is a 220 yards trap after passing the barracks. A reader was accused of covering the measured distance in eighteen seconds, whereas his speedometer was registering seventeen miles per hour.

Proportionate Fines.

The other day Mr. J. H. B. Damon, of Chelsea, was driving a motor bicycle through Richmond Park on the road between Priory Lane and the Richmond Gate. Immediately on entering the park he was stopped by a park-keeper and accused of travelling at the rate of twenty-one miles an hour. When the case came on the list of "offenders" was headed by Miss Dorothy Levitt, who was fined £2 11s. 6d. for travelling at a speed of nineteen miles an hour. When Mr. Damon's case came on he was fined £3 11s. 6d. The contrast between nineteen and twenty-one miles an hour is not great, but for a motor bicycle costing £50 to be fined £1 more than a car costing several hundreds seems to be hardly right. It is quite time something was done to render these fines being dealt with in a more equitable manner.

ALL THE WORLD

is talking of the ROC—"the car on two wheels." The Roc live axle, with clutch and speed gear, is the key to the future of motor cycling. The 1908 season has proved its efficiency in practice.

The 1908 ROC is also conspicuous by, e.g., the ball-bearing engine, the low duplex frame, the new large silencer, the remarkable control. The Roc 4 h.p. Royal Military Model, inclusive of these features, sells at 48 gns.

Early deliveries.

SPECIAL NOTICE.—Machines sent to the works for Roc clutch and gear conversions can now be promptly dealt with and the conversions returned complete and tested in about three days from receipt.

A. W. WALL, LTD.,
ROC MOTOR CYCLE WORKS, BIRMINGHAM.

A RUBBER NON-SKID

CORRECT IN THEORY,
PERFECT IN PRACTICE.

CUSTOMERS WRITE—

"The feeling of security from side slipping increases the pleasure of motor cycling. I have successfully competed in the London to Edinburgh run on Three Spires Non-skid, this is a proof of their reliability."

"I fitted a Three Spires Non-skid Tyre to the driving wheel of my Twin Minerva for the London to Edinburgh 24 hour trials, the tyre carried me through, and since I have ridden 1,000 miles, and it shows little wear; I have not had a single puncture and have found it a perfect non-skid."

Write for special offer to readers of "The Motor Cycle."

THE

Coventry Rubber Co., Coventry

Write to us

about the new mount you want to get. The range of N.S.U. models extending all the way from the 1½ h.p. Lightweight to the 6 h.p. Twin offers you a selection of superlative excellence such as to meet your every requirement.

Each N.S.U. model has a well earned and enviable reputation behind it. In every hill climb, touring test, and feat of endurance, the N.S.U. is always in evidence. 12,000 N.S.U. riders can tell you of its merits. Without the N.S.U. Catalogue you are buying with the most important motor cycle out of your consideration.

MAKE A NOTE OF THE

N.S.U.

N.S.U. MOTOR CO., Ltd., 78, Charlotte St., London, W.

N.S.U. Non-skid Device makes side-slips impossible.

It requires two minutes to attach it. Price 3/6.

N.S.U. Sparking Plug solves all misfiring troubles.

N.S.U. Two-speed Gear levels all hills.

N.S.U. Belt Fasteners ensure an easy mind.

Write us about all these, too.

End-to-end Ride.

The 3½ h.p. motor bicycle which A. D. Powell, of Leicester, will ride in the Land's End to John-o'-Groat's Trial next week will be fitted with a new pattern Fitall hub gear.

A Two-seated Tricycle.

On June 10th an illustration appeared of a motor tricycle built to the order of Dr. Bradburne. The appearance of this illustration has led to numerous enquiries from various of our readers, and Dr. Bradburne has requested us to state that, as the machine was put together under his supervision by a local agent, he cannot answer the queries as satisfactorily as he would like. He is therefore anxious to hear of a person or persons who would care to take up the manufacture and development of the idea.

A Tricar in the Team Trials.

A tiller-steered tricar, driven by J. Portwine in the Team Competition at Daventry, was much admired. It is called the Weller, and is propelled by an air-cooled engine 90 by 102 mm., with two outside flywheels, through a hub two-speed gear and plate clutch. The frame is open and suspended on long laminated springs. Unfortunately, it did not make a non-stop run owing to oil getting on the contact maker and causing bad misfiring on a steep hill. We understand that Boots, Ltd., cash chemists, have two similar tricars running daily in London traffic.

An All Night Ride.

The Essex M.C. has arranged an all-night ride to Yarmouth on Saturday evening, the 18th inst., leaving Barnard's Hotel, Chelmsford, at 11 p.m.

A.C.U. End-to-end Run.

An interesting entry is that of Mr. A. F. Wilding, the well-known lawn tennis player, who competed in the championships at Wimbledon last week. Mr. G. W. Hillyard, secretary to the meeting, is also a most enthusiastic motor cyclist, and that his name does not appear among the list of entrants is a matter of regret.

Speed Trials at Portmarnock.

The Dublin Centre of the Motor Cycle Union of Ireland have arranged the following programme of races on Saturday next, July 11th, at 3 p.m.: Event I., two miles members' handicap. Event II., four miles members' handicap for the Dunlop Cup, cylinder capacity not to exceed 350 cubic centimetres. Event III., twenty miles open handicap for Kavanagh Cup. Entries close to-morrow (Thursday) evening. All competing machines must be equipped with proper motor cycle saddle, tyres, and two independent brakes. Club medals for first and second in each event, also third prize if more than twenty entries. It is probable that an event for members of the Dublin and District M.C.C. will be included. Entry forms can be obtained from the hon. sec., Mr. J. S. Armstrong, 34, Oakley Road, Rathmines, Dublin.

Nottingham Motor Cyclists.

In one month the membership of the Nottingham and District Motor Cycling Club has reached a total of forty-five. A writer in a local paper advises the committee to accept small car owners as members, but it is questionable if all mixed clubs are such a success as he imagines.

Admission will be 1s. Tickets and full particulars may be obtained upon application to the hon. sec., Mr. Harold Fuller, Wynndale Road, Woodford, Essex.

A.C.U. 24 Hours Ride.

The A.C.U. annual twenty-four hours' ride from London to Plymouth and back will start from the Angel Hotel, Thames Ditton, on Friday, August 7th, at 9 a.m. Both private and affiliated members may compete in this event, and the entrance fee will be 10s. 6d. There will be a timed test between Yeovil and Honiton, outwards and homewards, the time allowed being 1h. 32m. each way, and competitors who arrive within three minutes either in advance of or behind this time will qualify for a gold medal, provided the performance on the other part of the journey merits it. Those competitors who complete the journey but fail to ride the timed section within the limits allowed will qualify for a silver medal.

Cyclists Fined for Excessive Speed.

Four colliers were recently fined 40s. each at Newport for riding push bicycles at sixteen to eighteen miles an hour at Rogerstone. Four others were fined 20s. each for riding at a rate of sixteen miles an hour. A superintendent said that some of these young colliers rode down the valleys at a terrific rate, and were a source of danger.

The Popularity of Magneto Ignition.

From the list of entries for the six days' reliability trial, published on page 542, it will be seen that no less than fifty-seven of the sixty-four machines entered are fitted with magneto ignition.

FUTURE EVENTS.

- July 9—Five Miles Handicap at Chesterton, Cambridge.
 „ 13-18—A.C.U. LAND'S END TO JOHN-O'-GROAT'S SIX DAYS' RELIABILITY TRIAL.
 „ 14-15—M.C.U.I. (Ulster Centre) Open 400 Miles Reliability Contest.
 „ 18—London and South Western Bank Five Miles Motor Cycle Race at Herne Hill.
 „ 18—Gymkhana at Birmingham (two open events for motor cycles).
 Aug. 3-4—Motor Cycling Club Run to Land's End and back for Charles Jarrott Cup.
 „ 7—A.C.U. 24 Hours' Ride, London to Plymouth and back.
 „ 8—Essex M.C. Open Race Meeting at the Stadium.
 „ 15—Coventry M.C. Open Hill Climb for Motor Cycles.
 „ 22—A.C.U. Annual Race Meeting at the new Stadium, Shepherd's Bush.
 „ 29—Essex M.C. Open 200 Miles Non-stop Run for Motor Cycles.
 Sep. 12—Motor Cycling Club Petrol Consumption Tests.
 „ —The International Auto Cycle Tourist Trophy Race in the Isle of Man.

Essex M.C. Gymkhana.

A gymkhana takes place on Saturday next at the cycle track, High Beech, Loughton. A very interesting programme has been arranged, and among the items included are tilting at the rings, Turk's head cutting, musical chairs, and an obstacle race. The proceedings will commence at 3.30, and during the progress of the sports tea will be served on the lawn at 5.30.

A competitor in the Hull and East Riding A.C.C. Hill-climb held on Saturday last.

MOTOR CYCLE RACING AT BIRMINGHAM.

AT the Aston Villa Grounds on Saturday, 6,000 people witnessed some good and exciting racing at the *Sport and Play* meeting. The results of the events for motor cycles were:

One Mile Lightweight Machines.—H. V. Colver ($2\frac{3}{4}$ h.p. Matchless), 1m. 19s., 1; F. E. Barker ($2\frac{3}{4}$ h.p. Rex), 1m. $26\frac{3}{5}$ s., 2; J. C. Smyth ($2\frac{3}{4}$ h.p. Rex), 1m. $27\frac{2}{5}$ s., 3.

Two Miles Match.—C. R. Collier, 1; H. V. Colver, 2; H. Martin, 3. Won by inches. Time, 2m. $15\frac{4}{5}$ s.

Three Miles Tourist Handicap.—Heat winners: V. Yates (Rex), 9s.; H. A. Collier (Matchless), 5s.; J. Smyth (Rex), 12s. F. E. Barker, was fastest loser. Final: Collier, 1; Yates, 2; Barker, 3. Time, 4m. $17\frac{2}{5}$ s.

Five Miles Triangular Pursuit Race.—C. R. Collier, 1; H. V. Colver, 2.

In an attack on the five miles motor record, C. R. Collier did 6m. $31\frac{4}{5}$ s. The existing record, held by S. Wright, was 6m. $58\frac{1}{5}$ s.

Start of the final Three Miles Tourist Handicap Race, which F. A. Collier won from Smyth, Yates, and Barker.

POLICE TRAPS ON THE END-TO-END ROUTE.

Mr. S. W. Carty, of Newcastle-on-Tyne, writes: "As I understand that the greater part of the route for the above trials is rather dangerous from a trap point of view, might I ask the motor cyclists who live in the neighbourhood of any of these danger zones to perform a sportsmanlike action by turning out and acting as amateur A.A. scouts and warn competitors when they are likely to get into trouble if they do not ride well under twenty miles an hour."

TWO TWENTY-FOUR HOUR RIDES IN ONE WEEK.

A motor cyclist who is anxious to take part in both the M.C.C. run from London to Land's End and back, August 3rd and 4th, and the A.C.U. London to Plymouth and back run on Friday, August 7th, at 9 p.m., points out that it will be impossible for him to do so unless the rides are put further apart. Two long distance rides such as the above certainly should not be fixed for the same week, and it is not likely that many private owners will attempt both runs.

Meet of the Nottingham and District M.C.C. at Osmaston Manor, the beautiful residence of Sir Peter Walker, Bart.

OCCASIONAL COMMENTS.

By "IXION."

A Magneto Tip.

Occasionally a loss of power is noticeable on a machine that has seen two or three seasons of use which defies even skilled attention. If the ignition be the Simms magneto, a point may have escaped attention which has a vital bearing upon the engine's efficiency. If the flat spring of the contact breaker be pushed aside, the brass cover slipped off, and the contact breaker detached, it will be noticed that the arm carrying the rocking platinum has a heel shaped like a ball, and that it is this ball which is lifted by the projections on the fibre cam. This ball is only subject to very minute and gradual wear, since it is of hardened steel, and its friction is against a softer substance, to wit, fibre. None the less it does wear in time, and the effect of wear upon it is obvious. Such wear reduces the distance by which the points separate, and retards the moment at which they separate. As new platina are likely to have been fitted in the distance the machine has covered, the gap at the break may have been corrected by adjustment of the platina, but unless the magneto has been retimed, although the break of the platina is correct in distance, it is wrong in time, occurring too late in the stroke. The simplest test will be to borrow the contact breaker off a newer magneto, if one is available. If the substitution of this effects an increase of engine speed, it is clear the older machine is timed too late. The gap being correct, it is by no means necessary to buy a new bell crank, cheap as this part is. A cure will be effected if the engine be carefully retimed according to the maker's instructions, which take into consideration the moment at which the break occurs in relation to the piston's stroke. But a new bell crank is advisable, since the hardening of the ball is only skin deep, and when case hardening is once worn through, the softer metal beneath will perish rapidly.

Cams on Aged Machines.

The above paragraph reminds us of a common source of weak running in ancient machines, whether creaky or otherwise. The valve cam is another case hardened part, and a part, too, which is subject to much heavier wear than the bell crank referred to above, especially if there be no trip hammer or bell crank, but the cam acts direct on the vertical valve tappet, as is the case with most early engines. The case hardened metal polishes noticeably in 2,000 miles, even with an interposed crank or roller, and begins to wear appreciably in 5,000 miles. Minus an interposed crank or roller, it wears even faster. Wear at this point has an insidious effect on the engine, and often escapes notice. Its result is that the tappet continues working vigorously, but with a reduced lift, and no matter how accurate the $\frac{1}{32}$ in. gap between the toe of the exhaust

valve and the tappet, the valve is not getting its full lift, and the exhaust is choked, thereby causing overheating and loss of power in the engine. A precisely similar result follows from worn brasses in the timing gear. The spindles of the cams, instead of lying snugly in round holes, lie at the bottom of oval holes, and so the axis of the cam is farther beneath the cylinder than it ought to be. Thus, even if the cam is unworn, the valve is not being lifted as high off the seat as it ought to be. This single fact shows how the sum of the minute wear in each of a number of brasses may very considerably reduce the power an engine was once capable of developing.

Wait till the Solution is "Tacky."

I wonder how many thousands of pneumatic tyre users have had occasion to curse that little word "tacky," so glibly employed on the flysheet of repairing instructions enclosed with every tyre outfit. "Tacky" is a term that covers every condition of glutinosity, ranging from the moist, treacly aspect of the newly spread rubber solution to the dry and parchy appearance it presents when it is ready for the patch to be applied. A thousand times have I attempted to find a better word, or even a string of words, which should guide the novice in tyre repairing to choose the psychological moment at which alone he can apply his patch to his tube with any real hope of its adhering; and a thousand times have I failed. Let me only say that the mistake of ninety-nine amateur tyre repairers out of a hundred lies in applying the patch far too soon, when the solution is far too moist and glossy. When it is ready to adhere to your tyre as tenaciously as the French nail or the bit of wire that called it into requisition, it is all but devoid of gloss. It has almost lost its wet and glutinous appearance, and looks as if you could lay a biscuit on it without a single crumb staying behind. But the only safe plan is for the novice to take a length of old tubing, and to make four or five test patchings, applying the patch in every condition, one with the solution shinily wet, another with the solution as dry as a bone in a cathedral crypt, and others at the varying interims. He will then learn to recognise for himself that delicious stage of tenacity in which the patch lays itself meekly but firmly over the injured tube, and with never a curl of the lip settles into a contact actually as firm as that of accurate vulcanisation. There are men on the road who can patch the tube off a 40 h.p. Fiat so perfectly that it will remain airtight indefinitely; and there are others—and those the great majority—who would bungle and botch a repair for a Dursley-Pedersen push cycle. And it is just accuracy in choosing the moment at which the solution is "tacky" which differentiates expert from duffer, given good solution for both.

AUTO CYCLE UNION
LAND'S END TO JOHN-O'-GROAT'S TRIAL
OF MOTOR CYCLES,
JULY 13th to 18th.

WE have prepared this map of the End-to-end route with a view to assisting readers who live within reasonable distance of the line of the route to trace the most convenient point and time at which they can see the trials competitors. Routes from the principal towns are shown in dotted lines, and the approximate distances can be measured by the scale of miles at the foot of the map.

On page 542 will be found a full list of entries, and also the registration numbers of the competitors' machines. It will, therefore, be a comparatively easy matter to recognise the riders as they pass, provided the spectator possesses a copy of this issue of *The Motor Cycle*.

The daily itinerary is as follows:

MONDAY.

Leave Land's End ... 8 a.m.
Arrive Launceston ... 12.6 p.m.
(Lunch, White Hart Hotel.)
Leave Launceston ... 1.36 p.m.
Arrive Taunton ... 5.26 p.m.
(Sleep, London Hotel.)

TUESDAY.

Leave Taunton ... 8 a.m.
Arrive Worcester ... 1.50 p.m.
(Lunch, Star Hotel.)
Leave Worcester ... 5 p.m.
Arrive Warrington ... 7.55 p.m.
(Sleep, Patten Arms.)

WEDNESDAY.

Leave Warrington ... 8 a.m.
Arrive Kendal ... 11.40 a.m.
(Lunch, Station Hotel.)
Leave Kendal ... 1.10 p.m.
Arrive Moffat ... 5.40 p.m.
(Sleep, Buccleuch Arms.)

THURSDAY.

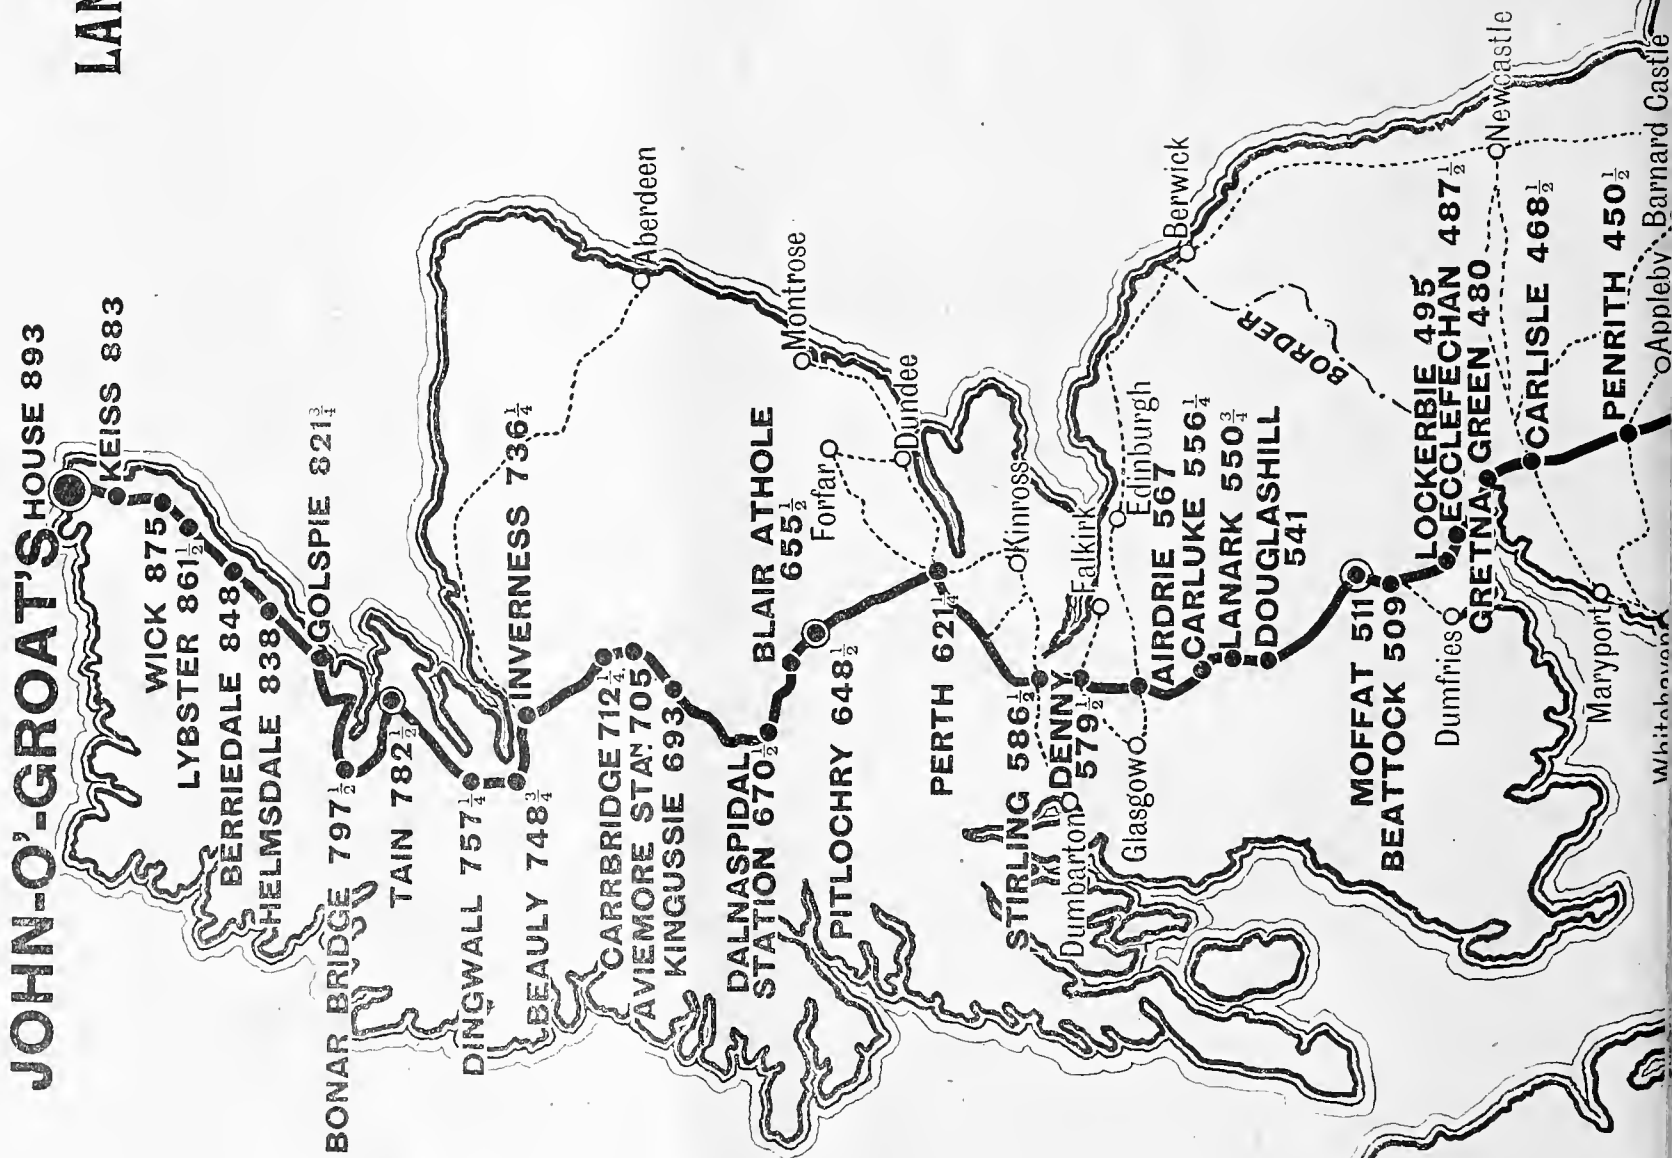

Leave Moffat ... 8 a.m.
Arrive Stirling ... 12.14 p.m.
(Lunch, Station Hotel.)
Leave Stirling ... 1.44 p.m.
Arrive Pitlochry ... 4.25 p.m.
(Sleep, Scotland's Hotel.)

FRIDAY.

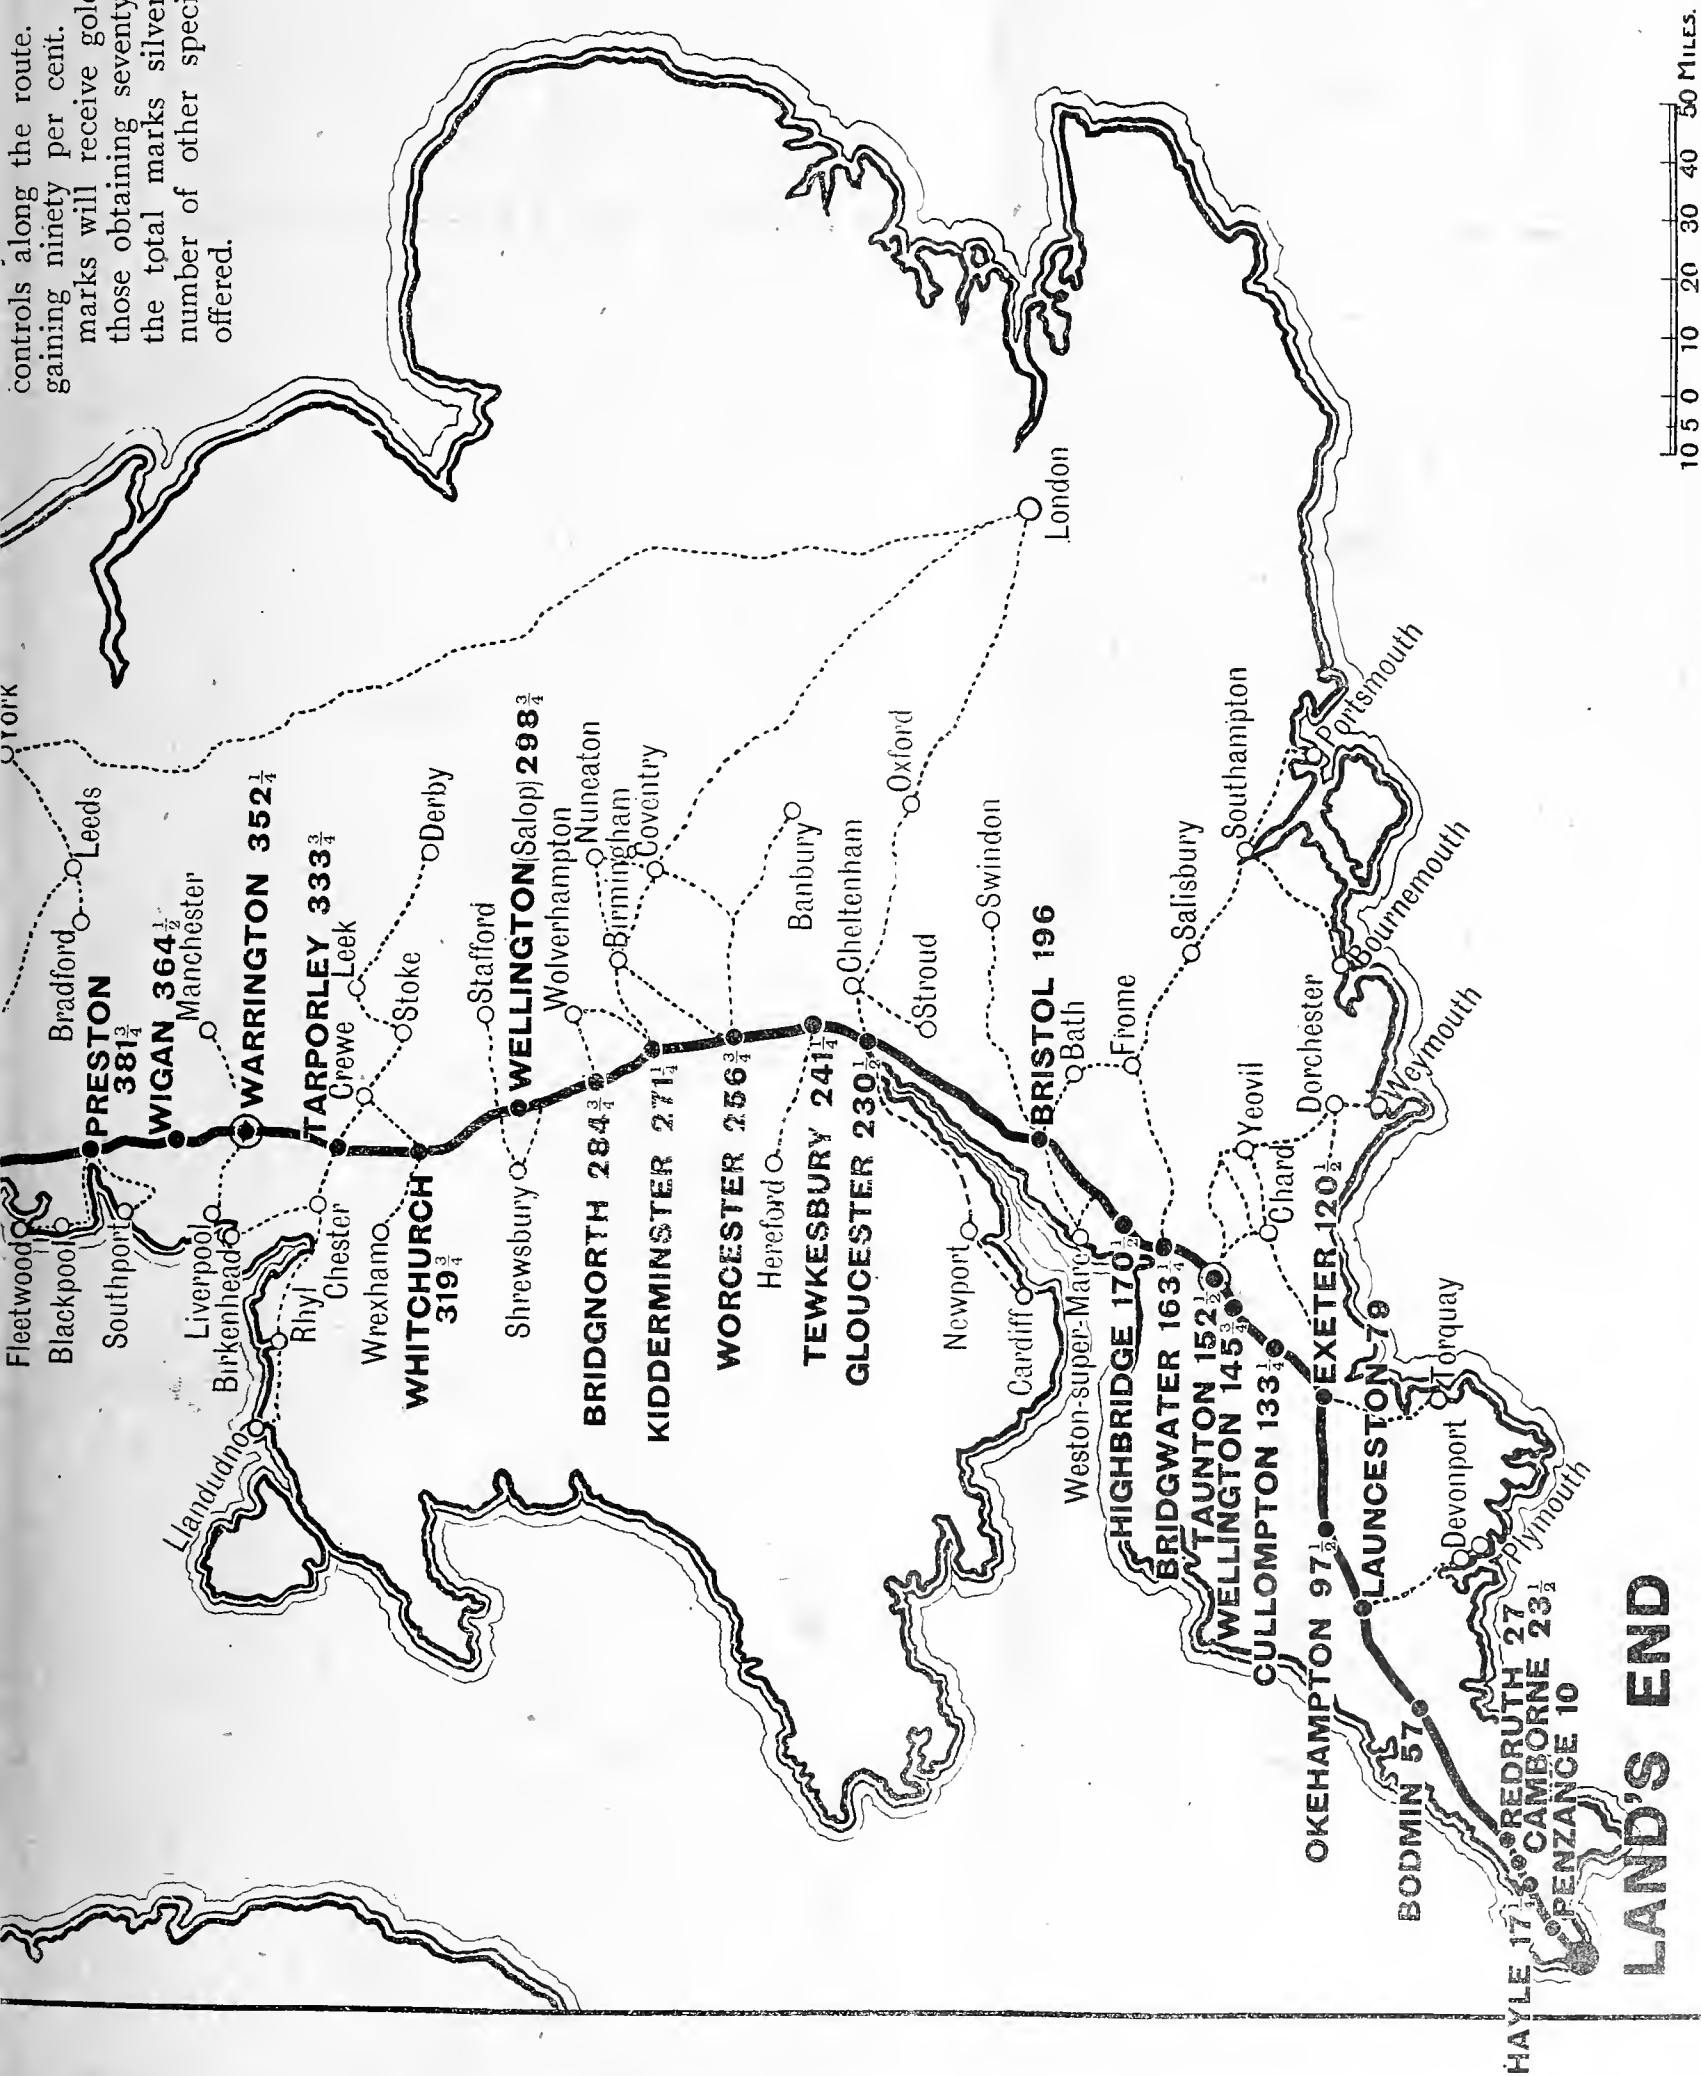

Leave Pitlochry ... 8 a.m.
Arrive Inverness ... 12.55 p.m.
(Lunch, Station Hotel.)
Leave Inverness ... 2.23 p.m.
Arrive Tain ... 4.46 p.m.

SATURDAY.

Leave Tain ... 8 a.m.
Arrive Wick ... 1 p.m.
(Lunch, Meredith's Hotel.)

controls along the route. Competitors gaining ninety per cent. of the total marks will receive gold medals, and those obtaining seventy per cent. of the total marks silver medals. A number of other special prizes are offered.

Hints to End-to-end Competitors.

HINTS to competitors in the Land's End to John-o'-Groat's run have already appeared in these columns, but most writers have dealt with the preparation of the machine. I. B. Hart-Davies sends us some hints for the comfort of the rider which will, no doubt, be appreciated by those who have not hitherto taken part in a long-distance event. He says: "One can get exceedingly dirty after a few days on the road. Nevertheless, even the necessities must be cut down to the finest point. I find a soft flannel collar is best, since a spare one takes up less room, and can be crushed. Pyjamas are a luxury, and must be barred, since they also occupy too much room. The touring outfit should then consist of hairbrush and comb, razor and brush, spare shirt to be used for sleeping in, pair of slippers, clean flannel collar, handkerchiefs, toothbrush and powder, and pair of socks. A bag should then be sent to the third stopping place, addressed to the official hotel, containing a complete change of underclothing, etc., and a spare tube (butt-ended). If this is sent off from Penzance by passenger

train, the bag will be there in plenty of time, and can be forwarded on again to Wick if necessary.

"I tried this plan last year, and found it very successful, the change of clothes being a great relief. Carpet slippers are essential, for one's feet get tired during the day, and, unless the boots are a loose fit, one usually ends by going to bed early or borrowing the landlord's.

"A small silk scarf will be found very useful in preventing the neck being chafed by an umbrella coat, or for warmth should the weather turn chilly, incidentally keeping the hair and collar clean.

"An umbrella coat should be found room for on the carrier. As rain protectors they are unequalled, but too hot to wear in fine weather.

"With a first class machine, careful driving, and the above kit, an easy journey should be assured, provided that the weather maintains its good behaviour, and I for one am looking forward to a sporting event which I am sure will appeal to every healthy motor cyclist. May we all get there, and, what is more to the point, all get gold medals."

CLUB NEWS.

S.E. Auto Cycle Association.

The following list of fixtures has been passed by the committee: Penalty run, speed-judging contest, members' hill-climb, 100 miles reliability trial, also another open hill-climb, and a light car trial (open). The dates of these competitions can be obtained from the hon. sec., H. B. Renner, 1, Kidbrook Park Road, Blackheath, S.E.

Eastern District M.C.

Mr. T. Andrews has been returned winner of the speed-judging competition. The run on the 12th inst. is to Southend; 19th inst., St Margaret's; and 26th inst., Huntingdon.

An enjoyable run (in conjunction with the Western District M.C.) was held on the 28th ult. to the residence of the president, Mr. F. Leverton Harris, M.P., Burford Bridge, Dorking, where tea was served to a large gathering. Members left late in the evening. The president has kindly presented the club with a trophy for competition, conditions of which will be announced later.

Richmond and District M.C.C.

On the 28th ult. a handicap petrol consumption trial for motor bicycles and passenger machines was held, the route being from the Assembly Rooms, Surbiton, to the top of Leith Hill, *via* Epsom, Leatherhead, Dorking, and Coast Hill. A picnic was held at Leith Hill, at which a good number of members and friends were present. The prizes for the consumption trial were kindly presented by Miss Ingram, the gold medal being awarded to Mr. K. Lankester, whose petrol consumption worked out to 125 miles to the gallon. Mr. F. C. Wood won the silver medal. After enjoying the magnificent view on the top of Leith Hill, the club then proceeded to the Hut at Wisley for tea, *via* Newlands Corner.

Members are reminded that a reliability trial takes place on July 11th and 12th, for which the captain, Mr. Carpmal, has kindly presented a challenge cup for competition. The start will be made from the Assembly Rooms, Surbiton, at 2.30 p.m. sharp. Competitors will stay the night at Worthing. Entries should be sent to the hon. sec., H. C. King, Walton House, Surbiton Road, Kingston-on-Thames.

Newcastle M.C.

The second annual reliability trial was held on June 25th to Levenhall, near Edinburgh, *via* Berwick, the total distance being 228 miles. Passenger motor cycles and small cars were scheduled to run at seventeen miles per hour, and large cars and motor cycles at twenty miles per hour.

Twenty starters faced the timekeeper (Mr. J. Tunnah) at 4.30 a.m. The secretaries, Mr. J. P. Robson and Mr. B.

Wilford, were in attendance, and had made complete arrangements. The weather was of exceptional warmth and brilliancy.

Between Belford and Beal A. D. Mullen had ignition troubles, and beyond Ayton, W. Dunn was delayed fifty-five minutes by a bad puncture. A compulsory stop of two hours was arranged for lunch at the Royal Hotel, Portobello.

The first competitor to start from Levenhall on the return journey was E. H. Lowe, who, however, lost considerable time with punctures between Dunbar and Berwick. Tea was partaken of at Berwick at 4 p.m., and the competitors then entered on the last sixty-two miles of the run. At Alnwick the competitors were checked for time, as also on the outward journey. The following completed the run: W. Dunn (3½ h.p. Dene), James R. Moore (3½ h.p. Dene), Isaac Baty (3½ h.p. Dene), A. Clark (3½ h.p. Dene), G. Walker (3 h.p. F.D.W.),

Some of the competitors in the Newcastle M.C. Edinburgh and Back Reliability Trial on the 25th ult., at the start, 4.30 a.m.

A. S. C. Broadway (3½ h.p. Rex), O. E. Slater (3½ h.p. Dene), H. Bell (3½ h.p. N.S.U.), D. J. Wright, and A. D. Mullen. Passenger motor cycles: R. B. Smith (5 h.p. N.S.U.), F. Lee (4½ h.p. Frank), and N. Simpson (6 h.p. Singer).

The awards will be made immediately after the time sheets come in from the various controls, and the club member who made the most consistent running to schedule time will hold the Arthur Lucas Challenge Bowl for twelve months.

Valuable assistance was given to the club by Mr. A. Smart (who had charge of the Alnwick control), Mr. J. Malcolm (at Dunbar), Mr. Percy McHutchen (at Levenhall), Mr. J. Campbell, jun. (at Berwick), and Mr. Arthur J. Lucas and Mr. Alan G. Robson as judges at Newcastle.

Club News.—

Western District M.C. (London).

An inter-club competition of members of the above club and the N.W. London M.C. will take place on the 12th inst., the course being a circular one from Gerard's Cross, a total distance of about 100 miles.

Sheffield and Hallamshire M.C.C.

About twenty-two competitors took part in a fast and slow mile test last Saturday on the top of Mam Tor (Derbyshire). The rider who made the greatest difference between fast and slow times was declared winner. The results were: 1, Mr. S. Sawyer, 9m. 8s. difference; 2, Mr. Tysson, 7m. 56s. difference; 3, Mr. Torr, 7m. 20s. difference.

Nottingham and District M.C.C.

At the general meeting on the 29th ult. it was announced that the membership had reached forty-five. Mr. H. Dennis Bayley, of Lenton Abbey, has consented to become president of the club, whilst Dr. Fulton, Dr. Fisher-Ward, and Mr. Edward Powell have also consented to become vice-presidents. A club run was held on Saturday, the 4th inst., to Osmaston Manor, and the outing was much enjoyed by all present.

North-west London M.C.C.

This club was favoured with brilliant weather on the occasion of the picnic lunch in Ashridge Park on June 28th. The members met at Berkhamstead, and then proceeded, by kind permission of Earl Brownlow, to the chosen spot in the park, from which magnificent views over the vale of Aylesbury are obtainable. Lunch over, the party proceeded *via* Ivinghoe and Dunstable to tea at the Bull, Redbourn. From there a pleasant run back to town terminated a delightful outing.

Middlesbrough and District M.C.C.

On Wednesday last a 100 miles reliability trial was held from Marton Bungalow to York and back. Fourteen started, and only one experienced any mechanical trouble, viz., G. MacLauchlan, who was supplied with water-cooled oil for air-cooled oil in Middlesbrough, and experienced engine troubles. The Gyers Cup and gold medal were won by E. Young; silver medal, G. R. Sanderson; bronze medal, J. Bellerby. The competitors were: W. H. Rudland (3½ h.p. Kerry), A. H. Harbottle (2 h.p. Triumph), E. Rees (2 h.p. Minerva), E. Young (3 h.p. Bradbury), J. Bellerby (3½ h.p. Minerva), W. A. Duchars (3½ h.p. Rex), R. W. Day (3½ h.p. N.S.U.), G. R. Sanderson (3½ h.p. Triumph), W. A. George (3½ h.p. Rex), J. H. Dale (3 h.p. N.S.U.), Chas. Burnett (5 h.p. Rex), G. MacLauchlan (3 h.p. Rex), W. Danby (3 h.p. N.S.U.), and S. L. Gjertsen (3½ h.p. Triumph).

Hull and East Riding A.C.C.

On the 4th inst. a members' hill-climbing competition was held, and a good number of entries were received. In Class I., for machines not exceeding 80 mm. by 80 mm., W. Crawford (2 h.p. Minerva) won on formula, Mrs. A. Tomlinson (2½ h.p. Kestrel-Jap) being second. (Five entries.) Class II., single-cylinder machines, any capacity—1, Mr. Mumby (3½ h.p. Triumph); 2, R. Pearson (3½ h.p. Minerva); 3, Mrs. Tomlinson (2½ h.p. Kestrel-Jap). (Thirteen entries.) Class III., multi-cylinder machines—1, J. McDougall (6 h.p. Sarolea); 2, A. Willis (5½ h.p. Rex). (Four entries.) Class V., passenger motor cycles—1, Sergt.-Major Evans (5 h.p. Vindec Special and sidcar). (Three entries.)

Next Saturday the reliability run to Scarborough and back will be held, the first competitor leaving the Haworth Arms, Newland, at 9.30 a.m.

Lincolnshire M.C.C.

The gymkhana announced for to-morrow (Thursday) is postponed. Instead of the meet at Revesby on Saturday, the meet will be at Beelsby Hall, where Mr. J. P. Sowerby will entertain the members. Beelsby is seven or eight miles south-west from Grimsby.

The results of the Lambcroft hill-climb, so successfully arranged and managed by the Grimsby Centre, are as follows: 2 h.p. class.—1, T. G. Dobson (2 h.p. Minerva), 58½s., figure of merit 23.48; 2, V. Pearson (2 h.p. Imperial), 71½s., 20.69; two other competitors. Single-cylinder class.—1, T. G. Dobson, 58½s., 23.48; 2, V. Pearson, 71½s., 20.69; 3, H. W. Quine (3 h.p. Peugeot), 71½s., 20.69; ten other competitors; fastest time, E. J. Baskcombe (3½ h.p. Triumph), 51½s. Multi-cylinder class.—1, H. Haagensen (5 h.p. Vindec), 50s., 13.97; 2, G. P. Cusworth (5 h.p. Peugeot), 47½s., 11.60; 3, W. J. Clarke (5 h.p. Rex), 42½s., 10.86, and fastest time.

Dublin and District M.C.C.

On Saturday afternoon a reliability trial was held from Dublin to Maryborough and back, a distance of about 100 miles. At the start the weather was fine and the roads were very dusty, but *en route* the competitors ran through a heavy thunderstorm near the Curragh. Seven competitors faced the starter—D. J. Quirke (2½ h.p. Ariel), T. W. Batey (2¾ h.p. F.N.), W. Reilly (2 h.p. F.N.), F. J. Walker (5 h.p. Rex), J. Browne (3½ h.p. Triumph), and R. H. Taaffe (3½ h.p. Triumph). T. W. Batey was the only one to qualify for a silver medal.

York County M.C.C.

On the 29th ult. about twenty members took part in a twelve hours non-stop reliability trial over a circular course of forty-one miles. The course was from Wetherby to Boroughbridge and back, and was traversed five times. The winner proved to be H. Wilkinson (3½ h.p. Triumph), who only lost 9 marks, and will be entitled to hold the Triumph silver challenge cup for twelve months, and the club's standard gold medal; 2nd, H. H. Charge (3½ h.p. Triumph), 12 marks, silver medal; 3rd, F. W. Savory (3½ h.p. Triumph), 16 marks, bronze medal.

Newcastle and District M.C.C.

The second round of this competition was run off on Monday evening of last week from Blue House, Newcastle, to Rochester and back *via* Otterburn, seventy miles non-stop.

MR. NICHOLSON'S TEAM.

A. D. Nicholson (3½ Triumph) ...	75
J. J. Hall (3 Quadrant) ...	30
T. W. Hall (3 Quadrant) ...	75
J. S. Tweddle (3¾ N.S.U.) ...	75
Total marks ...	255

MR. AUSTIN'S TEAM.

L. Austin (3¾ N.S.U.) ...	75
E. G. Parker (3½ N.S.U.) ...	75
W. Dunn (3½ Dene) ...	35
G. Svendsen, non-starter.	
Total marks ...	185

MR. ROSENVINGE'S TEAM.

L. Rosenvinge (3¾ N.S.U.) ...	75
R. Embleton (3½ N.S.U.) ...	75
C. Reinhart (4 N.S.U.) ...	75
B. Bradford (3½ Dene) ...	75
Total marks ...	300

MR. OUTWIN'S TEAM.

W. H. Outwin (3½ Triumph) ...	75
R. Wilson (4 N.S.U.) ...	75
L. Dixon, disqualified for starting late.	
F. Wilson, non-starter.	
Total marks ...	150

The third and final round will be run off on July 25th, at 3.30, between the following teams: Mr. Nicholson's, Mr. Rosenvinge's, and Mr. Bates's. (This team drew a bye in the second round.)

The course on which this final will be run is from the North Gate, Morpeth, to Wooler and back, then from North Gate to Alnwick and back, the distance being almost 100 miles. Several stiff hills will be encountered on the route.

Motor Cycle Union of Ireland.

The annual competition for the Triumph Cup between the Dublin and Ulster Centres took place on the 27th ult., starting from Tolka Bridge, Dublin, and the conditions were that no stop would be allowed except at Dundalk for petrol and the level crossing at Newry. The following riders competed:

Ulster Centre.—T. Greer (5½ h.p. Rex), J. L. McNeill (3½ h.p. N.S.U.), C. E. Murphy, J. Stewart, T. Dickson, S. S. Brady, J. J. Kennedy, F. H. Maclean, T. T. Maclean, G. Simpson, M. J. Lindsay, and B. J. McManus (all on 3½ h.p. Triumphs), J. S. Garrett (3½ h.p. Rex), J. Lavery (3 h.p. Triumph), Hugh Denby (3½ h.p. Brown), W. J. Andrews (5½ h.p. Rex), J. Meggarry (2¾ h.p. Minerva), J. McAllen (3 h.p. Rover), J. Holden (3 h.p. Rover), L. MacLaine (10 h.p. Lagonda Tricar), R. Sharpe (5½ h.p. N.S.U.) sidcar, and W. H. Loughran (4½ h.p. F.N. sidcar).

Dublin Centre.—R. E. Price, R. H. Farmer, T. J. Dunphy, E. Farmer, and J. Reilly (all on 2¾ h.p. F.N.'s), H. Quinn (3 h.p. Triumph), and R. Walsh (2¾ h.p. Jap).

Non-stop runs were made by:

Ulster Centre.—T. Greer, J. L. McNeill, C. E. Murphy, D. Stewart, T. Dickson, S. S. Brady, J. J. Kennedy, T. T. MacLean, G. Simpson, M. J. Lindsay, and B. J. McManus.

Dublin Centre.—R. Walsh, H. Quinn, E. Farmer, T. J. Dunphy, R. H. Farmer, and R. E. Price.

The Ulster Centre was therefore declared to have won the Cup, and this being the second year in succession it becomes the property of this centre.

Complete List of Entries for the End-to-end Trial.

WITH PARTICULARS AND IDENTIFICATION NUMBERS OF THE COMPETITORS' MACHINES.

Questions & Replies.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Carbon Deposits.

? Kindly inform me as to the cause of the formation and deposit of carbon in the cylinders, and whether carbon is to a small extent always deposited, or if it may be entirely prevented? Also as to the best way of keeping the amount deposited at a minimum?—W.G.N.

The deposit of carbon consists chiefly of the residue left from burnt lubricating oil combined with a quantity of road dust drawn in through the air intake of the carburetter, etc. It can be prevented by using the very best oils, avoiding over-lubrication, and by keeping the inlets of the carburetter gauze-covered. It cannot, however, be avoided entirely.

Dual Ignition and Separate Plugs.

? Can you tell me if it is feasible to fit dual ignition to one plug? Shall I need a special two-way switch to do so if it is possible, and will the wiring need to be altered at all? The tricar is fitted with accumulator and magneto ignition, with adapters on the cylinders, and I wish to do away with the adapters, as they get red hot and cause pre-ignition.—L. L., Newcastle.

It is inadvisable to fit dual ignition with one set of plugs, as it entails the use of a complicated high tension switch, which is difficult to make and difficult to insulate. Moreover, if you buy one, it is bulky and expensive. Generally speaking, it is safe to rely upon a magneto alone.

Position of Silencer and Magneto.

? Some time ago I fitted a new silencer to my $3\frac{1}{2}$ h.p. Rex motor bicycle. The silencer is fitted in front of the magnets and between the magneto and the front mudguard, and the exhaust pipe just touches the magneto on the right hand side. I am told this is injurious to the magneto. Is this so?—E 789.

If the exhaust pipe in question renders the magneto very hot, it is possible that it may do damage owing to melting the insulation of the armature winding. It would, however, take considerable heat to do this, and we should recommend you to feel your magneto after a long ride, and unless it is so hot that you cannot bear your hand on it, leave things as they are.

Specification of a New Machine.

? I am thinking of having a motor cycle built to the following specification, and should be glad of your advice: 4 h.p. J.A.P. engine (85 by 85 mm.), Chater-Lea frame, B. and B. carburetter, J.A.P. automatic lubrication, 24in. by $2\frac{1}{4}$ in. wheels, Shamrock-Excelsior back, Palmer front, Riche's detachable tubes, $\frac{3}{4}$ in. Shamrock-Gloria belt, Chater-Lea spring forks, belt rim brake (foot applied) and Bowden back rim, coil and accumulator ignition, no pedals, T.B. hand starting device, S.N.P. stands, Advance adjustable pulley. Please say if this meets with your approval, or would the 85 by 95 J.A.P. be better? I weigh just under ten stones.—A.A., Warwick.

We agree with your specification except as regards the following points: We strongly recommend 26in. wheels, as 24in. tyres cannot be obtained without much difficulty in the country. Ignition, we strongly recommend a magneto. A $\frac{3}{4}$ in. belt is not large enough for the power, $\frac{7}{8}$ in. or even 1in. would be far better. If you have an engine

with a long stroke it may not run quite so smoothly, but it will be better for hill-climbing.

Reducing Speed and Petrol Consumption.

? I recently purchased a second-hand $3\frac{1}{2}$ h.p. Excelsior motor bicycle. It will take me (fourteen stones) up all the hills in this district, but the slowest pace I can get is about fifteen miles per hour, and not more than forty-five miles to the gallon of petrol. The Longuemare carburetter is fitted with a spray of 11 slots and 21 choke tube. As I want to run the machine as economically as possible, I shall be glad of your advice.—C.B., Oxon.

There is something seriously wrong with the carburetter, as the consumption is excessive. Are you certain that there is no leakage from any of the tank, feed pipe, or carburetter unions? If not, check the level of the spirit. It should rise to within $\frac{1}{8}$ in. of the top of the jet orifice. If this is in order you might try a smaller spray and see the result. The machine should run at six or eight miles an hour, and should do about ninety miles to the gallon.

J. W. Ardern (Sheffield and Hallamshire M.C.C.) starting on his $3\frac{1}{2}$ h.p. Phelon and Moore for the second fifty miles in the M.C.C. Team Trial at Daventry, June 27th.

Controlling Needle Valve of Carburetter.

? My machine is a $3\frac{1}{2}$ h.p. Kerry, fitted with Longuemare carburetter and accumulator ignition. (1.) The carburetter floods very badly, and it will not take any extra air. I also notice that the valve in the float chamber of the carburetter jumps about a great deal when engine is going. Is this correct or not? (2.) When carburetter seems to be right as regards the flooding, the engine is very hard to start, and will only run on top speed with spark advanced to the full. (3.) Should there be a flap covering the whole of the tube, to be lifted by the suction of the motor in the ordinary air inlet of carburetter?—S.W.

(1.) You might try fitting the needle with a damping arrangement in the form of an adjustable screw to prevent needle jumping up too high. Also see that the level of the petrol is right by removing the jet. It should come up to within $\frac{1}{16}$ in. of the top of the pipe into which the jet screws. (2.) Probably too large a choke tube is fitted; try a smaller one. (3.) On one pattern of Longuemare carburetter a flap was fitted.

Adjustment of the Carburetter.

? I have a $2\frac{3}{4}$ h.p. Minerva, and have just fitted a B. and B. carburetter. The latter is for a twin-cylinder engine, but I have blocked up one induction port and put a smaller jet in, which is about No. 32. Machine starts easily, and on the stand will respond to ignition lever and throttle, and will take a little extra air. On the road the machine has no pace, and will not climb a very moderate hill. I may say that when extra air is open, by placing the hand over same, petrol is emitted from the opening. The petrol drips from under spray chamber when standing. The compression is good, and ignition seems to be in good working order. The machine is geared $4\frac{1}{2}$ to 1, rider eleven stones.—R.S.C., Darlington.

The trouble seems to be due to the fact that the jet is too large, or level of spirit is too high. You should try a smaller jet (27 or 28) and so arrange matters that the carburetter will take full air with throttle say half open when the machine is running as fast as possible. If the petrol drips from the

spray chamber when the machine is standing, it indicates that either the level of the petrol is too high, or the needle valve is not closing properly. You should grind the latter in with a little crocus powder and oil.

Using Other Peoples' Property.

? (1.) A party borrows, hires, or takes goods to repair, and by accident, even without their knowledge, damage occurs while in their hands. (2.) Is the said party compelled to pay a bill to cover the cost of making good the said damage if they have not been previously notified that the said damage had occurred in their hands, or even that damage had occurred at all? (3.) Supposing the party had been notified that damage had occurred in their hands, have they a right to possession of the damaged goods for the purpose of making good the said damage occasioned while in their hands? (4.) If the party offers to pay for new goods said to be damaged, have they a right to the old and damaged goods which they replace? (5.) If the party pays money unasked to defray the cost of new goods which are to replace the old and damaged goods, have they still a right to possession of the said old and damaged goods?—W.H.M., Sheffield.

Our legal adviser's replies to the above questions are as follows: (1.) If a party borrows goods without paying anything for the use of them, he must take particular care of them, and is liable, even though there is only very slight negligence on his part. If he hires them, or has goods for the purpose of repairing them, then he must take such care of them as an ordinary business man would of his own goods. He is liable for negligence, but not if the negligence is very slight. You will thus see that each case must depend upon its own merits, and the answer to question 1 is, therefore, that the party is not liable if the matter was a pure accident, and there was no negligence whatever. The fact that the damage was done without the knowledge of the person who had the goods would perhaps imply that he was not taking proper precautions for their safety in his absence. (2.) Assuming that the party is liable, then the sum that would have to be paid would, of course, be the cost of making good the damage done. The owner of the goods should certainly have intimated beforehand that damage had been done, and have given an opportunity for the party liable to inspect the goods before they were made good. If he does not do so, I think a jury would recognise that it places the defendant in an awkward position, and would probably knock something off the total amount claimed.

This, however, would be purely a matter of fact for a jury to decide. (3.) The party who did the damage cannot insist on making it good himself, but if he offers to do it for a certain sum, and the party gets it done at a higher sum elsewhere, then the jury ought to award the lower sum, and not the higher, provided that the party offering to do the work is fully competent so to do. (4 and 5.) No; but if it is arranged for new goods to be supplied, then the value of the old goods must be allowed.

Maladjustment of Carburetter.

? My motor cycle is a $3\frac{1}{2}$ h.p. 1907 Minerva, standard model, and I think there is something wrong with the carburetter, as I cannot get more than about fifty to sixty miles per gallon. I notice that petrol spurts out at the top of carburetter past the needle, and also drops apparently from the spray down the air adapter through the fixed air chamber, and this, no doubt, may account for my apparently heavy consumption. I notice if I happen to raise the needle, and then press it down quickly, the weights appear to hold the float up, and do not allow it to again sink down until the needle has been raised. Do you consider this a fault? And would you advise fresh weights? Perhaps it may be that the level of the petrol in the carburetter is too high, and if so, what must I do to lower the level? I also experience a difficulty when starting the motor when cold, unless I inject a little petrol through the valve on the cylinder. I should like, if possible, to make it so that the motor could be started very quickly, as having to run with the machine for some distance before firing is not very suitable for my weight (sixteen stones).—J.R.W., Preston.

The petrol leaking past the top of the needle valve is due to the latter having too much movement, or there is too much clearance in the hole, and some device to restrict its movement should be fitted. If you raise the weight on the needle valve you will lower the level of the petrol. The correct level is about $\frac{1}{16}$ in. to $\frac{3}{16}$ in. below the top of the jet orifice. Also examine the float mechanism and see that the float acts properly. The needle should be right down when petrol tap has been turned on a few seconds. If it does not seat itself petrol is flowing past the valve. Invaluable hints on carburetter adjustment are to be found in the latest edition of "Motor Cycles and How to Manage Them." The wrong adjustment of the carburetter is the cause of your engine starting sluggishly.

The new list of vulcanising appliances just issued by Messrs. Harvey Frost and Co., Ltd., makes most instructive reading, and motor cyclists should secure copies from the firm's West End branch, 27, Charing Cross Road, W.C. All the various H.F. vulcanisers are fully described and illustrated, and some useful and interesting information on vulcanisers and vulcanising generally is embodied. No charge is made for the list.

BRADBURY

We claim the following
advantages over motors
of any other type.

Powerful Vertical Engine.
Strongest Pattern Frame
with all Straight Tubing.
Engine Case forms basis of
Frame. Perfect and Per-
manent Alignment. Long
Bearings of Phosphor
Bronze. Mechanism eas-
ily accessible. It runs
smoothly and quietly, and
every Engine gives its
advised power. Less
Vibration than any other
Motor of same power. The
Best Hill Climber. Per-
fect Balance.

AWARDED 17 GOLD MEDALS IN RELIABILITY TRIALS.

2¼ h.p., £25; 3 h.p., £32; 3½ h.p., with spring fork attachment, £40.
4½ h.p. Motor Fore Car, open frame, water cooled, two speeds, free engine £85.

PRICE LIST AND NAME OF NEAREST AGENT ON APPLICATION TO DEPARTMENT M.

Bradbury & Co. Ltd., WELLINGTON Oldham.
WORKS,

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Hulse and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

MOTOR BICYCLES FOR SALE.

HALIFAX.—Note the great reduction in prices of twin Rexes. All in running order; £17 17s.

HALIFAX.—4½ h.p. magneto twin Minerva, spring forks, nothing better necessary; bargain, £27 10s.

HALIFAX.—3 h.p. Fafnir, special low frame, 26 wheels, vertical engine; £13 10s.

HALIFAX.—1908 3½ h.p. N.S.U., magneto, 26 wheels, 24 tyres, long bars, only does 100 miles, and guaranteed perfect; £34 10s.

HALIFAX.—1908 Rex Featherweight magneto, Duplex frame, done 250, almost equal new.

HALIFAX.—2½ h.p. Coronet, light and low, 26 wheels, free engine clutch, very smart; £12.

HALIFAX.—5-6 h.p. twin Rex, spring forks, low frame, R.O.M. ignition; £19 10s.

HALIFAX.—4 h.p. Alcyon, fine 26 by 24 tyres, twin, spring forks, N.S.U., two-speed gear, light and low; £23 10s.

HALIFAX.—3½ h.p. Simms, vertical engine, magneto ignition, easy starter, reliable; £17 10s.

HALIFAX.—2½ h.p. Clyde, vertical engine magneto ignition, splendid condition; £16 10s.

HALIFAX.—Powerful 3½ h.p. Rex, 22 frame, vertical engine, aluminium finish, £11 10s.

HALIFAX Motor Exchange.—Cash, exchange, or extended payments. High-grade machines purchased for spot cash.—16, Westgate, Halifax. Telephone, 766. Telegrams, Perfection.

TAKE YOUR CHOICE.

No other house in the trade has such a fine selection of new and second-hand machines in Stock. You will nowhere obtain such a liberal allowance on your second-hand machine. Take advantage of *The Motor Cycle* Deposit System and have a motor cycle at once on approval.

DERMATINE BELTS
HOLD ALL RECORDS.

End-to-End Record, June 9th and 10th:

Mr. A. W. Bentley, using Dermatine belt.

M.C.C. 24 Hours' Ride to Edinburgh,

June 5th and 6th:

35 were successful, using Dermatine belts.

Stadium Race Meeting, June 8th:

Harry Martin, First in Ten Miles Race.

Stadium Race Meeting, June 24th:

Again the first, second, and third winners were fitted with Dermatine belts.

No other belt holds such records. The Original Rubber and Canvas Belt.

BEWARE OF IMITATIONS. The standard belt that is adopted by all leading manufacturers.

End-to-End Record.

Read the testimonial from the Triumph Co. Coventry, June 22nd, 1908.

Mr. Stanley Webb, 32, London Road, Bromley, Kent.

Dear Sir,—I do not know whether we have written to you about the Bentley End-to-End record. Mr. Bentley had a Stanley Dermatine Belt fitted to his motor cycle. It gave him entire satisfaction, and had not to be touched once during the whole ride of 886 miles.

Yours faithfully, M. J. SCHULTE, Manager Director, Triumph Motor Co., Ltd.

Second season in use, and still going strong.

125, Bunhill Row, E.C., 12/6/08.

Dear Sir,—You will be pleased to hear that the "Dermatine" Belt I used in this year's London-Edinburgh run gave me no trouble whatever, and that, moreover, it was the identical belt I used in last year's L.-E. run. It is still going strong, though having run nearly 3,000 miles. Yours faithfully, J. P. LE GRAND.

800 miles, and no trouble nor once shortened.

Southernhay, Loughton, June 12th, 1908.

Dear Sir,—I must again congratulate you upon your excellent belts, as the one I used on my 3½ Vindex in the Schulte Cup Competition to Edinboro' and back gave me no trouble whatever, and was not even shortened once in 800 miles. I consider this a severe test, and a splendid proof of efficiency.

Yours faithfully, OWEN L. SUMMERS.

Hundreds of Testimonials. British Made.

THOSE HILLS YOU PEDAL.

Read this extract from testimonial.

Before I had the gear I had frequently to use pedals to assist engine up steep pitches, but since purchasing the gear from you, I have never on the road had to use the pedals and can easily get up any hill round here including Clayton and Hand Cross with passenger on board.

H. ASHLEY GAITSKELL, M.D.

THE BURGESS ENGINEERING Co., Oxford Road,
Clarendon Park, LEICESTER. Tele: 4251.

31 h.p. Motor and Sidecar, both in splendid condition, will exchange for 3 1/2 h.p. low built machine, or best offer.—144, Silver Street, Edmonton.

EXCHANGE, new 4 h.p. Fafnir engine, w.c., carburetter, tank, pump, silencer, 12in. reversing propeller, for good motor bike, or £20.—Cook, 72, Harcourt Street, Newark, Notts.

PIANOLA, by Chase and Baker, splendid instrument, in perfect order, and two rolls music, cost 52 guineas, for late 1907 Triumph, or sell cheap. — 27, Cleveland Square, Liverpool.

LADYBACK Tandem, gold lined, Palmers, plated rims, Anatomical lady's saddle, a handsome machine, for motor bike, Italian mandoline for adjustment.—11, Battlemount, St. Albans, Herts.

EXCHANGES are arranged at Wauchope's. —Second-hand machines are allowed for in part payment for new models of any leading make.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

MILLS and Fulford Motor Trailer, nearly new, Dunlop tyres; exchange for sidecar, or good clutch and speed gear to fit Kerry, 3 1/2in. belt drive, or sell 75s.—Apply, Hodges, Broadway, Addlestone.

EXCHANGE, for good motor cycle, tricar or reliable car, new high-class furniture, any description, valued wholesale, direct from works, or second-hand, excellent quality furniture, in nearly new condition, or sell cheap for cash.—Furniture Manufacturer, 7-11, French Place, Shore-ditch, London.

EXCHANGE Bradbury Tricar, 5-6 h.p., water-cooled, two speeds, free engine, coach-built front, bucket driving seat, wheel steering, chain drive, for 6 h.p. N.S.U., or other good make, with sidecar, and two-speed, cash adjustment.—Cooper, motorist, Staveley, Derbyshire.

EXCHANGE.

EXCHANGE, new B.S.A. road racer, frame 23in., three-speed Tricoaster, Dunlop tyres, lined in red and gold, for motor cycle, or sell £9. — W. Hewett, jun., 39, Alfred Road, Acton, London.

SMART 4½ h.p. Sunbeam Car, beautifully upholstered, perfect, seats three, £60, take reliable make tricar and cash; photographs required and given; no cards.—Stanley, "Reynoldsville," Walsall.

EXCHANGE, 8 h.p. Rex Car, two bucket seats, three speeds and reverse, Michelin tyres, nearly new, in good going order, for lightweight motor cycle; good price allowed for Motosacoche, or take £45 cash.—Glover, Witham, Essex.

EXCHANGE Thornton-Pickard Half-plate Stand Camera, complete, also telephoto lens, printing frames, lamps, acetylene generator, dishes, and many other accessories too numerous to mention, all nearly new, been very little used; will exchange for good 3½ h.p. motor cycle; will give little cash if required.—For full particulars apply, W. O. Williams, Pen-y-Bont, Garn Dolbenmaen.

WANTED.

WANTED, Sidecar, in good condition. — Moore, 27, Curzon Street, Long Eaton.

26 by 2½ Beaded Front Wheel, to fit N.S.U. —15, Charlotte Street, South Shields.

WANTED, Motor Car, Tricar, or motor cycle; cheap.—209a, Peckham Rye, S.E.

31 h.p. Magneto, up-to-date; must be sound and cheap.—17, Acre Lane, Brixton, S.W.

GOOD Magneto Motor Cycle; cheap for spot cash.—Gittins, Church Street, Oswestry.

WANTED, Old Accumulators; best price given.—Motories, 3, Arley Grove, Armley, Leeds.

WANTED, 26 by 2½ and 26 by 2 non-skid wired cover; also 26 by 2½ beaded.—Watson, Bedale.

WANTED, Sidecar, suit twin Rex de Luxe, left side; full particulars.—Bamber, Totley Rise, Sheffield.

MOTOSACOCHE wanted, must be in good condition and cheap.—Cripps, Wellington, Parkstone, Dorset.

WANTED, good Sidecar, will give gent's 10-guinea pedal cycle, new.—Farrar, Square Road, Halifax.

2 h.p. Minerva Engine, with carburetter, complete, for cash; no rubbish.—Trapps, 34, Bishophill, York.

WANTED, any good make motor cycle, magneto, and two speeds preferred.—Farrar, Square Road, Halifax.

WANTED, Cars, Tricars, or Cycles to repair and sell on commission.—Wood, 50, Victoria Road, Stroud Green.

1907 Triumph, or other good magneto machine; give reasonable cash price.—Butcher, 19, Union Street South, Halifax.

MOTOR Cycles in part exchange for new 1908 Moto-Reve lightweights; immediate delivery.—Crisswell's Garage, Newmarket.

WANTED, 3½ h.p. 1907 Pattern Triumph motor bicycle, with magneto.—Apply, The Warminster Motor Co., Ltd., Warminster.

WANTED, good single-cylinder magneto, in level exchange for spring fork twin Rex.—Box 203, The Motor Cycle Offices, Coventry.

WANTED, Good Motor Cycle, exchange two old paintings and 9 carat gold chain and cash.—Smithers, "Eventyde," Woking.

WANTED, 3½ h.p. Motor Cycle, cheap, complete with magnto ignition; on approval.—H. Green, 1, Castle Square, Haverfordwest.

MOTOR Cycle; £20 cash; twin, magneto, two-speed, spring forks, Werner preferred, Ayrshire.—No. 215, The Motor Cycle Offices, Coventry.

HALIFAX. — Wanted, modern magneto single-cylinder machines; any quantity bought for spot cash. — Motor Exchange, Westgate, Halifax.

MOTOR CYCLISTS.

You can get rid of vibration and ride in comfort on the roughest roads if you have the

DRUID SPRING FORK

fitted to your machine.

It is worth while to learn all there is about this device. Send for the new booklet, your order will follow.

A. DREW,

74, Conybere Street, Birmingham.

A 3 h.p. Triumph

sold for

One Shilling.

The letter printed below shows how a reader of "The Motor Cycle" was able to sell his 3 h.p. Triumph through the medium of this journal, at a cost of One Shilling.

22, St. Alban's Road,
Moseley, Birmingham.
18th March, 1908.

Dear Sir,

I thought perhaps you would be glad to know that the 3 h.p. Triumph which I advertised in your journal on Wednesday last, was sold in consequence, next day, at my price, and to the very first applicant.

I certainly expected to dispose of same, but was not prepared for such an excellent and quick response to the advertisement.

Yours faithfully,

F. COWAN.

If you have a motor cycle to sell, or an accessory either, why not advertise it in "The Motor Cycle" too—the rate is One Penny per word, minimum One Shilling per paragraph.

Copy must reach us on Thursdays.

"The Motor Cycle," Coventry.
London: 20, Tudor Street, E.C.

Genuine Birmingham

"QUADRANTS."

A large stock of parts, still to be cleared.
Write for latest list.

REG. SAMSON,
232, LADYWOOD RD., BIRMINGHAM.

ADVERTISERS — Please note that Friday is the latest day we can receive advertisement copy for this following week's issue.

WANTED.

WANTED, 1908 Triumph.—K., Craigallion, Champion Hill, S.E.

WANTED, Cylinder for 3 h.p. Carlton.—K., 78, Harold Road, Upton Park.

LADY'S Motor Cycle, magneto, handle-bar control.—34, All Saints Street, Bolton.

B 100 Saddle wanted, good condition; cheap.—A.H.B.B., 132, Ferme Park Road, Hornsey.

WANTED, 26 by 2 wired cover, 2 h.p. inclined engine; 20s.—83, Brandon Street, Walworth.

CASH for up-to-date motor cycle. — Full particulars, R. Hill, Greatham, Stockton-on-Tees.

WANTED, Twin Rex Engine, 1906 model preferred.—Apply, 12, Mayfair Street, West Hartlepool.

WANTED, 1906 or 1907 Triumph, magneto and spring forks, for cash.—5, Heath Street, Hampstead.

WANTED, 1½ h.p. Minerva engine, good condition, for spot cash.—Leake, Harlington, Middlesex.

WANTED, engine, about 5-6 h.p., good condition.—3, St. Peter's Road, Kingsland Road, London.

SIDECAR wanted, in exchange for oak bureau, with cabriolet legs.—Lewis, 23, Arden Road, Handsworth.

WANTED, good Montgomery flexible sidecar, suit 1908 Triumph.—Wakefield, Appleton Street, Northwich.

WANTED, Green Carriage-built Sidecar, rigid; price; particulars.—Hendra, 33, Noble Street, London, E.C.

WANTED, 3½ h.p. N.S.U., or good make; must be cheap for cash.—W. Beaumont, Bird's Royd, Brighouse.

WANTED, Cars, Tricars, or Cycles to repair and sell on commission.—Wood, 50, Victoria Road, Stroud Green.

WANTED, 2 h.p. Minerva, spray and cash, for good make 2½ h.p., running order.—6, Islip Street, Kentish Town, N.W.

LATE 1906 3 h.p. Triumph, magneto, spring forks, good condition; cheap; approval.—2, Marshall Street, Barnard Castle.

41 h.p. Bradbury, or 5 h.p. Phoenix Triumph give 2½ h.p. Humber bike and cash.—5, Armitage Road, Milnsbridge, Huddersfield.

6-7 h.p. Car, Rover, Humber, or Siddeley, must be cheap; full particulars; would exchange 8 h.p. tricar and cash.—Carter's, Ibstock.

WANTED, Tricar, about 6 or 9 h.p., Singer, Riley, or other well-known make water-cooled only; cheap for cash; photo.—65a, Pearl Road, Walthamstow.

WANTED, powerful twin or F.N., 4½ h.p.; give £5 case Whitworth stocks and dies, taps, Buck and Hickman, or sell £22.—13, Brookwood Avenue, Barnes.

MOTOR Cycles, tricars, etc., received for sale; five per cent. for selling; no sale no charge; private buyers waiting.—Kemp's Blind Works, Loughborough Junction, London.

WANTED, Tricar, in exchange for 2½ h.p. Ariel cycle, splendid order, and gent's 18ct. gold keyless lever hunter watch, new.—8, Clifton Road, Squires Lane, Church End, Finchley.

MABON Free Clutch, latest, and foreca attachment (Manning's or Phoenix) with or without tyres, to suit 3½ h.p. 1908 Minerva; state price.—McLay, Kirkintilloch, Scotland.

MOTOR Cycle wanted, good order, up-to-date Triumph, Vindec, Roc, or Rev preferred; spot cash; also 1908 Montgomery sidecar.—Address, "Chauffeur," Eason and Son, Dublin.

WANTED, to purchase for cash, Triumphs, Quadrants, Minervas, Bats, Japs, Riley, and Lagonda tricars, or exchange arranged for new models.—Wanchope's, 9 Shoe Lane, London, E.C.

5 h.p. Cycle and sidecar, magneto, two speeds, or tricar, in part exchange for 12-14 h.p. car, new last July, fast, quiet, reliable; £75; trial and expert examination both ways.—452, Hackney Road, N.E.

In answering any of these advertisements it is desirable that you mention "The Motor Cycle."

Contact Breakers for Twin Cylinders.

By "IXION."

I RECENTLY received the "catalog" of an American make of motor cycle, in which the twin-cylinder specification included a contact breaker "specially designed to prevent one cylinder firing against the other." This is a point which has only recently come to the front in the home twin-cylinder usage. It is quite a number of years since I first owned a twin-cylinder motor cycle engine, and I got the most miserable results out of it. I tinkered away at the compression, the carburation, the valve timing, and what not, and although there was no audible misfiring, the power developed was simply contemptible in comparison to the stated capacity of the engine. Finally, in the course of many adjustments there came a day when the machine flew along like a thing possessed. I could not account for the sudden improvement. Everything was apparently in exactly the same condition as it had been on many previous occasions when the machine would barely stir, and I was about to write the whim of the machine down as one of those things "no feller can understand," when it dawned on me that since the compression and timing and carburation had not been tinkered with since the last failure, the secret must lie in the adjustment of the contact breaker. Next it dawned upon me to run each cylinder separately, by shorting the other with a screwdriver, and so the vital importance of synchronisation dawned on me, and I have never been at a loss with twin-cylinder ignition since. I want in these notes first to describe how mal-synchronisation can ruin the running of the engine, and then to consider various methods of breaking the contact from this point of view.

The Necessity of Perfect Synchronisation.

My worst illustration is from a big tricar. With this machine in tip-top order, barring ignition adjustment, I have known the second gear of $7\frac{1}{2}$ to 1 be required to take three persons up a very short grade of 1 in 25, and this without there being any misfiring (by "misfiring" in this connection I mean audible misfiring of the dot-and-carry-one or can't-we-bang-and-splutter type; literally, it was misfiring all the time, but the misfiring was of a smooth and inaudible kind). This being possible, we should all of us, down to the uttermost novice, understand the necessity of perfect synchronisation, and, further, select a device which will afford the greatest freedom from such annoying lapses of power. There are six standard devices, viz.,

- (1.) Two plain coils with make and break.
- (2.) Two trembler coils with wipe.
- (3.) Two trembler coils with make and break.
- (4.) Single trembler coil with distributor.
- (5.) Magneto.
- (6.) R.O.M. contact breaker.

In considering these various devices we have three points to keep in mind as ideal. One is reliability in the shape of freedom from dirt, wear, and derangement; the second is that any slight lapse from perfect condition should affect both cylinders equally, for it is a great deal better to have *both* cylinders 20% beneath maximum efficiency than to have one cylinder 5% under maximum efficiency and the other 10% under; and the third is ease and simplicity of readjustment.

Contact Breakers for Twin Cylinders.—

I.—Plain Coils with Make and Break.

The coil will give no trouble, being a plain one. The contact breaker has four platina and two spring blades, any one of which six parts may be separately affected by dirt or wear. This is especially likely if the platina are ordinary platina, and not "indestructible," i.e., of iridium or iridium compound. Further, its adjustment is a matter requiring skill, and scoring four minus marks; we therefore give this device ten bad marks.

II.—Trembler Coils with Wipe.

On this device we have the four platina on the coil and their two springs. In addition a wipe contact is a difficult thing to make, since the segments have to be mortised into an alien substance (e.g., brass into fibre); these two substances wear unevenly, and particles of metal get carried on to the fibre, and give circuit where it is not wanted. I should therefore give this device eight bad marks. It requires no adjustment, and scores on that point for its other shortcomings.

III.—Trembler Coils with Make and Break.

This device includes the six vulnerable points of the last as regards the coils, and further includes four additional platina on the contact breaker and two spring blades. As all of these are very readily subject to derangement, they incur twelve bad marks on my system of judging, and we have yet to consider the question of adjustment. There is no doubt that a most delicate and perfect adjustment is possible with this device. On the other hand, to get it exact is a most skilful operation, and not one that any driver would desire to face on the road—in fact, few owners of it take the trouble in ordinary use. A chauffeur can do it, an owner will do it for a timed hill-climb, but it scarcely enters the region of everyday use. And as even an approximately correct adjustment is more difficult to secure than with any other device, we must allot four minus marks on the score of adjustment, and state that, however desirable this ignition may be for racing (I am not sure it is not the absolute best for that purpose), it scores sixteen bad marks for ordinary touring use.

IV.—Single Trembler Coil with Distributer.

This device is not, so far as I know, employed on any motor cycle.

V.—Magneto.

The magneto contact-breaker consists of a revolving arm with two recesses in a fibre disc controlling the contact-breaking. The same pair of points control both cylinders, and a very wide range in the amount of break does not seriously impair the firing. Thus we are left with no other course of derangement than the wearing of the fibre. I have never yet had a fibre wear unless the rod from timing strap to advance spark lever has been bent out of truth, so I am rather loth to debit this device with any bad marks at all. Similarly, though there are two platina on the contact-breaker, the universal experience of motor cyclists is that these platina wear much longer and are less subject to pitting than the platina on any known battery ignition contact-breaker. In addition, there is no fear of oil getting on them, as they are not carried on the engine. Contrasting this device with the foregoing, two bad marks are the most we can honestly allot to it.

VI.—The R.O.M. Patent Contact Breaker.

In the R.O.M. patent contact-breaker, we have a device that endeavours to secure the advantages of the magneto contact-breaker for a battery and coil-ignited engine. It is newly on the market, by comparison, and is very highly spoken of. On an examination of it, we find that it is so constructed that the losing of temper by the single blade, or the pitting, oiling, or soiling of the platinum, will affect both cylinders equally, so that synchronisation is never affected, though the efficiency of both sparks may gradually be equally reduced by wear. The wearing points, however, are iridium indestructible points and a hardened steel cam, and we know we need not expect wear with these save after prolonged running. Only a very exhaustive practical test can prove whether this is equal to the magneto. It can scarcely be superior,

A smart-looking twin-cylinder, which is as efficient as it is handsome, is the 4½ (67×72) h.p. Phenomen depicted above. Frame, tanks, and hubs are all enamelled French grey, and the machine has been nicknamed the motor cycle "Grey Ghost." The machine was brought round to Tudor Street the other day, and proved to be so well adjusted that it could be started by sitting astride and by pushing along the ground with one's foot. A trial run proved the machine to be comfortable, flexible in traffic, and steady in grease.

but because of its theoretic excellences—the improbability of wear and the maintaining of accurate synchronisation under all conditions—I am inclined to debit it with no more bad marks than the magneto (that is to say, two), and to rank it bracketed first, level with the magneto. Tabularly arranged, the results of my enquiry are as follows:

Contact-breaker.	Marks Debited.
1. { Magneto } 2	
3. Two trembler coils with wipe	8
4. Two plain coils with make and break ...	10
5. Two trembler coils with make and break	16

I hope this article will provoke some discussion. It is not theoretical, for I am no theorist—it is merely a string of deductions from prolonged road experience, written from the standpoint of an ordinary easy-going motor cyclist who desires the best average results with a minimum of trouble and a maximum of regularity.

The Ruthhardt Motor Cycle Magneto.

A MAGNETO possessing some novel features has been introduced by the Ruthhardt Magneto Co., Hatton Garden, E.C. The magneto, like other ignition devices of this type, hails from Stuttgart, and is a worthy follower in the steps of its predecessors. Its chief novelty lies in the shape of the magnets, which it will be seen on referring to fig. 1 are circular. The pole pieces are not separate, but form a single piece with the magnets. Wherever possible aluminium is employed, and this fact in conjunction with the construction of the magnets renders the instrument considerably lighter than any other on the market—a point of no small importance where saving of weight is extremely necessary as in the case of a motor bicycle, since it weighs only $4\frac{1}{2}$ lbs., while the height is only 4in. and the width $3\frac{5}{8}$ in. Fig. 2 shows the contact breaker. The casing has attached to it the inclined plane A, with which the fibre roller C loosely mounted on the spindle J comes in contact as the armature shaft revolves. The result is that the roller is pushed forward, carrying with it the spring arm G, thus causing the platinum points attached to G and the screw H to separate. The primary current is collected by means

Fig. 1.—The Ruthhardt single cylinder motor cycle magneto.

of a carbon brush in contact with the spring B from the face of the condenser case N (fig. 3). The earth connection D makes contact with a nut not shown in the illustration, which when unscrewed allows the contact breaker to be removed. Fig. 3 shows the armature, the spindle of which is provided with ball bearings at both ends, that on the left-hand end not being shown in the illustration owing to its being concealed by the end plate O. The condenser N is neatly carried at the end of the armature. In case of the H.T. terminal becoming disconnected, and an unfair strain being put on the insulation of the armature winding, a safety spark gap R (fig. 1) is provided. The magneto is compact, light in weight, efficient, giving as it does a flaming spark at low speeds, and most accessible, since it can be easily taken to pieces and cannot be wrongly assembled. We shall look forward to hearing accounts of its behaviour under actual road conditions, as there appears to be no reason why these should not be entirely satisfactory. An arrow stamped on the contact breaker shows the direction in which it is intended the magneto shall run.

Engine makers are asked to send literature and manufacturers' prices to the Fowler-Manson-Sterman Cycle Mfg. Co., 240-254, West Lake Street, Chicago, Ill.

Fig. 2.—CONTACT BREAKER.

L, h.t. collector ring
M, armature winding
N, condenser
O, end plate covering ball bearing
P, contact breaker

Realising that there is a demand at the present time for a reliable motor cycle speed indicator, Messrs. Stewart Clarke and Co., Denmark Street, Charing Cross Road, have given their attention to a special model, suitable for motor bicycles and tricars, which is sold at a moderate price. The instrument itself works on the centrifugal force principle, following lines which have previously been found to be quite successful. An innovation, however, is the design of the flexible shaft,

which is usually one of the weakest points in speed indicators of this type. In the Stewart Clarke, however, the shaft consists of hardened steel hooks revolving in a tube consisting of coiled hardened and tempered steel ribbon, the whole being enclosed in a casing of brass. If anything should happen to the shaft, it can be easily repaired by inserting a spare link without the aid of tools. Spare links will be supplied with the speedometers free of charge.

London to Edinburgh on a Lightweight.

By H. G. COVE.

EVER since the lightweight motor bicycle came into prominence I have watched its progress with great interest, and although I have always thought that there were great possibilities for it, I never believed it could be a successful machine in an arduous competition like a twenty-four hours run. My opinion was that for the "potterer"—that is, the man for whom speed had little attraction, and whose mileage was never more than 100 miles a day, the lightweight would be very useful, but for the motor cyclist no one delighted in competition work, and especially a little burst of speed occasionally, I certainly thought the lightweight machine would be useless. It is very strange how one forms opinions, sticks to them, and believes them to be perfectly true, until circumstances happen which show how wrong one has been in the past, and how easy it is to form incorrect views when one has not sufficient data to go upon.

This has been amply brought home to me within the last few weeks, and the lightweight motor bicycle is the sole cause of it. I had entered for the London to Edinburgh run on my 4 h.p. J.A.P., and having had it in good trim had little doubt of my success. However, in an evil moment I decided to take the machine down and replate and enamel all over. This was my undoing, for when the parts had gone to the platers I discovered that the work could not be finished in time for me to take part in the E. run, on my own machine at any rate.

Why I Rode a Lightweight.

I had so made up my mind to add a further medal to my store that I looked around to see from where I could borrow another machine, and after many enquiries and persuasions I got a little Moto-Rêve, looking upon it as a last chance—in fact, almost a forlorn hope. I took delivery of this machine—which, by the way, was the identical one that had climbed the greater portion of Sutton Bank a week or two previously—on the Thursday before the start of the London to Edinburgh run, and, having given it a trial, I made the best of my way to Highgate, prepared to do my utmost.

At four minutes past ten, word came from the starter to go, and away I sailed on the 400 miles journey.

Barnet, Hatfield, and Welwyn were soon left behind, and a quarter of an hour before time I found myself at Biggleswade, quite prepared for the hot coffee and sandwiches which were ready for us. The machine so far had behaved admirably, and I was getting quite used to it. Filling up with petrol, I plunged through the rain, and, like other competitors, was glad to see Alconbury, and shortly afterwards signs of daylight.

I arrived at Grantham well in advance of schedule time, and so far had no trouble whatever. Here a good breakfast awaited us, to which I did justice. Owing, however, to my insufficient knowledge of the machine, I had given it far too much oil during the night, and I had to refill the tank with a mixture of air and water-cooled oil, which was all I could procure. Needless

to say, from Grantham to Wetherby, where a good supply of the correct Moto-Rêve oil awaited me, I had to travel very carefully, as the inferior stuff which I carried in my tank went in like treacle and speedily became as thin as water.

At Doncaster I noticed signs of misfiring, and on examination found that the back cylinder was not pulling as well as it ought to, but as nothing very serious appeared to be the matter I went on. As the morning advanced a strong head wind, which had sprung up early, increased in force, and this, together with the clouds of dust which blew right in my face, rendered driving very arduous. Strong

though the wind was, my little engine never faltered a moment, and only once on a steep hill had I to assist it slightly with the pedals.

At Wetherby I took the precaution to empty out the bad oil, thoroughly clean the engine inside and out with paraffin, and to fill up from the can of Price's. The head wind, if possible, increased in force, and at times the dust almost blinded me. All went well until I arrived at Scotch Corner, and here the misfiring I had previously noticed became very acute, so I thought it wise to have a thorough examination and see just what was wrong. Owing to the head winds and the misfiring I had already lost quite half an hour, and I now lost a great deal more time. On removing the induction pipe I found the collar of the back inlet valve had broken and a portion lay on top of the valve. This

The writer with the lightweight Moto-Reve.

London to Edinburgh on a Lightweight.—

kept jumping about, at times holding the valve down and at times releasing it, and therefore set up the misfiring I had observed. Upon searching in my tool bag for the spare inlet, I was horrified to find that it had a different lift from the valve I had removed. This took some time to alter, and I lost quite an hour before I got under weigh again.

I then proceeded towards Newcastle, but just as I emerged from the high level bridge I met a procession of teetotallers blocking the road. I made desperate efforts to get past, but all to no purpose, so had to spend half an hour cooling my heels whilst they proceeded. I arrived at last at the Grand Hotel, but only to find that the head of the procession was there, and by the time I had filled up with petrol and made one or two adjustments the teetotallers were again blocking my passage north, all the traffic being held up. It was therefore 4.15 ere I could get away from Newcastle, thus making me over two hours and a half late. I was warned of a police trap in Morpeth, but seeing nothing of it, and the magnificent road tempting me, I let my little mount go for all it was worth. I arrived at Berwick at 7.7, filled up with petrol, and left at 7.10, and thus was able to pick up threequarters of an hour valuable time.

I now calculated that if all went well the remaining fifty-eight miles could be easily accomplished in 2h. 50m. left at my disposal. Knowing the roads were good as far as Levenhall, I determined to drive hard, my idea being to get as near twenty-five miles an hour as possible, as this would leave me a few minutes to spare in the event of anything going wrong. I soon found that the machine was capable of far greater speed than I had imagined, and on the best portions

of the road thirty miles per hour appeared quite easy. At Cockburnspath I changed the belt, as it was bottoming on the pulley, and then journeyed on as fast as possible to Levenhall, where I arrived at 9.29. Here to my horror I felt the back tyre slowly sinking, and on examination found that a flint, or piece of glass, had cut the walls of the tyre, and having no time to mend the puncture, was compelled to complete the journey on the rim. This I safely accomplished, and the frame did not seem to be any the worse for such harsh treatment. A silver medal was my award.

Petrol for 400 Miles Costs 4s. 4d.

In reckoning up expenses and time occupied on the journey, I arrived at some very interesting figures, and I do not think that the cause of the lightweight machine can be furthered better than by my giving them. The distance covered—390 miles—was accomplished in just about twenty-four hours, and, therefore, with stoppages, an average speed of $16\frac{1}{4}$ miles per hour was maintained. If one makes allowance for time lost in repairs and spent in control, namely, five hours, we arrive at the fact that the average speed whilst running was $20\frac{1}{2}$ miles per hour, and this for a 2 h.p. twin-cylinder machine, with full roadster tyres and ample tools and spares, is remarkable. The whole weighs 90 lbs.

Now, as to the cost, I find I used three pints of lubricating oil, but I was driving fairly hard the whole of the time, and often giving more oil than needful. With regard to petrol, the cost I note was 4s. 4d., and this, owing to the extremely strong head winds, was more than would be the case in the ordinary way.

In conclusion, I can only say that the lightweights have now a champion in me, whereas before I looked upon them as expensive toys.

A LIGHT FOUR-WHEELER.

IN the M.C.C. London to Edinburgh twenty-four hours' run the smallest four-wheeled vehicle to accomplish the 400 miles within schedule time was propelled by a 5 h.p. 75 by 80 mm. twin-cylinder air-cooled motor cycle engine. Mr. Chater Lea, the driver, is seen on the identical vehicle in the accompanying illustration, and he was accompanied on the run by Mr. H. Compton. The return journey was made by road in two days, and we are told the only trouble experienced on the double journey was caused by two nail punctures. This is a really splendid performance for such a small vehicle, and some particulars of it will be interesting.

The frame is tubular, all hubs run on ball bearings, and the rear wheels have expanding metal to metal brakes. These brakes are operated by a pedal, a side lever operating a very powerful band brake on the gearshaft. The engine drives through a leather-faced cone clutch and two-speed gear box. The driving shaft is arranged as a continuation of the engine-shaft, and is carried across the machine, terminating in a sprocket from which the drive is by chain to one of the rear wheels. The drive is thus similar to that of a sidecar, there being no differential, and in practice we are told this system works perfectly. Starting is by handle (which is geared up, ensuring a quick start with the magneto ignition). Thumb slides on the steering wheel control the ignition and throttle, and a small lever on the wheel actuates the exhaust lifter

and provides a governor for the engine in traffic. The Carette, as it is called, is capable of speeds up to twenty-eight miles an hour. The accessibility of the engine, magneto, and carburetter will be noted, and the gears can be reached by lifting a floor board.

Mr. Chater Lea, on the 5 h.p. Carette, with which he won a M.C.C. London-Edinburgh Gold Medal.

A NEW HYDRAULICALLY-OPERATED CLUTCH.

THIS invention relates to a clutch for motor cycles and cars, and is described with reference to the accompanying drawing as applied to a motor cycle. The object of the invention is to operate the clutch hydraulically, thus obviating the necessity of rods, levers, and separating gear.

A represents the hub which has a portion B considerably enlarged to accommodate the flat disc clutches C, the alternate discs of which are keyed to the shaft D, which is revolved by the belt pulley or chain ring I attached to D. The other alternate discs C are keyed to the shell of hub B.

E is a leather piston mounted between two plates which are kept together by means of screws and nuts, the ends of which press against (when the gear is in operation) the disc clutches. The flange of the piston cup is kept pressed up against the walls of the clutch cylinder by a split steel ring. F is the cover of the clutch cylinder, and has a stuffing box or gland H in its centre through which a hollow shaft G passes. The form of joint shown at K is made so as to facilitate the removal of the gland H in order to repack the stuffing box.

The cover F and hub A revolve round the hollow shaft G which is stationary. In communication with the hollow shaft G is a pipe conveying the liquid and operating medium to the single cylinder pump and gear shown at M.

The piston of this pump has a spring attached to it in order to keep the liquid operated by the pump in a state of compression when necessary, the liquid being withdrawn by means of the operating pedal.

The operation of working the clutch is as follows: When the pedal attached to M is released the spring forces the piston in, driving with it the oil into the piston chamber of the hub A through the hollow shaft G, which in turn forces the leather piston E up against

the disc clutches C, which alternate disc being in frictional contact with the disc keyed to the shell or hub A, any rotating motion of the shaft D is conveyed to the hub A. Such amount of rotating motion is trans-

mitted to A according to the pressure of oil exerted in the clutch chamber. The operation of declutching is the reverse of that described above, viz., by pressing the clutch pedal down the oil is withdrawn from the clutch chamber and the plates are released.

A NEAT SPRING FORK.

A SPRING fork is an article which should be standard on every motor bicycle, and numerous are the ideas that have been patented to obtain that elasticity and ease of running on rough ground which is essential to the comfort of the rider.

One of the latest devices submitted to us has been designed and patented by Mr. W. Godden, Patent No. 2791, 1901, and as far as we know there is no fork similar in construction on the market at the present time. The wheel is held in a rigid fork, and brakes and girder forks can easily be fitted, as a vertical movement only of the wheel is allowed.

Reference to the line illustration shows three guide plates H, J, and J₁. Two of these plates are fitted with rollers A A A, which bear against the extensions of the fork blades K K and the handle-bar stem F. The coil springs B and C are centrally applied, and control both up and

down movements of the wheel.

We have not ridden a machine fitted with this spring fork, but from an inspection of a sample from which our line sketch was made we think it has possibilities, although there would be wear on the tubing against which the rollers take a bearing.

A most complete price list of parts has reached us from the South British Trading Co., Ltd., 13-15, Wilson Street, Finsbury, E.C., comprising the parts for all Vindec motor cycles for the past five years, as well as the parts of the Peugeot and F.N. engines and Bosch magnetos.

The Junior and O.T.A.V. Motor Car Co., 117, Long Acre, W.C., have taken up the agency of the 5½ h.p. O.T.A.V. voiturette—a vehicle which in that it possesses V belt transmission and air cooling may almost be classed as a motor cycle. In the near future we hope to publish a description of this little runabout.

Mr. Stenson Cooke, secretary of the A.A., instructed his patrols on the Land's End to John-o'-Groat's route to warn the competitors in the A.C.U. Trials of any undue activity on the part of the police in the districts through which they pass. The A.C.U. committee has accorded a hearty vote of thanks to the secretary of the A.A. for his generous assistance.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By
Road Rider.

(Continued from page 511.)

HANDLE STARTING.

234. Always pull handle up, never push it down. If position does not allow of pulling it up, disengage handle and re-engage dogs till it does. Never even pull handle up except with spark well retarded.

Do not grip handle, but allow it to lie loosely across first joint of the fingers, without the thumb encircling it at all.

Always flood the carburetter, and verify position of every lever, especially the spark advance, before pulling.

If engine is sulky, and known to be in tune and order, inject a few drops of petrol into cylinder.

Handle starting with magneto ignition is only recommended if the handle is set on a counter-shaft or on the rear axle. It is possible to start a twin-cylinder engine with magneto ignition and a crankshaft handle, but it will frequently be a weariness in the flesh. Often the contacts will have to be levelled up and washed with petrol before a start is obtained.

Common starting defects, when engine, etc., are known to have been perfect at the stop: coil trembler stuck, cylinders gummy, plug points too far apart or carbonised, dirt or stale petrol in carburetter, engine very hot, petrol turned off, and switch not on.

In persistent failure to start a twin-cylinder engine on the handle, engage top gear, release compression in one cylinder (by holding down inlet valve, or putting penny under an exhaust valve), get passenger to push while clutch is held out, engage clutch gradually when fair speed is attained, and release compression in second cylinder when first cylinder begins to fire. (N.B. This is given only for novices in emergencies.)

HANDLE-BAR SWITCHES.

235. Every motor cycle should have a positive means of stopping the engine carried either on handle-bar or steering wheel. With a tricar, the clutch may stick; a motor bicycle may sideslip. If the engine cannot be instantaneously and certainly stopped, the resultant damage will be largely increased.

HOT CRANKCASE.

236. The crankcase necessarily receives a certain degree of heat by communication from the cylinder, but this degree is very limited. If the crankcase gets hotter and hotter with each successive run, or any time gets so hot that the hand cannot be kept upon it, there is a serious leakage past the piston rings, which should be seen to.

LEAKY PETROL UNION.

237. A mere leak can usually be repaired with soap, seccotine, fish glue, or Cæmentum, aided or not by binding with insulating tape. A pocket soldering outfit is easily carried. If leak is in the union, a stuffing gland may be faked out of string, or a short piece of rubber tubing may be threaded over the tube.

LEAKY RADIATORS.

238. Failing prompt soldering, bind with rag or tape smeared with red or white lead.

LEAKY WATER PUMPS ON TRICARS.

239. If leak is per stuffing box, refill it with asbestos string well smeared with blacklead.

If leak is from lubricator aperture, keep well greased, and if this fails, refit lubricator to a six inch pipe made to fit tightly into original aperture, and carried up vertically therefrom.

LOOSE NUTS.

240. If a nut often comes adrift, and yet is in such a place that no ordinary adjustment will necessitate its removal, the end of its bolt may be slightly burred over with a light hammer, spreading the metal enough to prevent nut falling off. If nut ever has

The handsome challenge trophy presented by Mr. Henry Littlewood to the Barnsley M.C.C. for annual competition in hill-climbing. It was won for the first time last month by J. Marshall, who rode a 3½ h.p. T.T. Triumph.

to come off, a spanner will force it over burr, and restore the thread in passage.

If nut is a large one, and may need to be removed at any time, paint over bolt end with thick, ropy black paint.

If a small one, varnish with clear varnish. Nuts in accessible places which have to be constantly removed and replaced should be castellated, and the bolt fitted with a split cotter.

LUBRICATION.

241. One of the most important subjects to a motor cyclist.

1. Never use an unsuitable oil. Find out what make of oil the manufacturers of the engine recommend; don't listen to them if they advise their own brand, as you cannot be bothered to carry it on tour, but get the name of a brand that is everywhere obtainable, and ask the factors of it for a list of agents. Never buy unknown brands, nor yet oil from cans previously opened, or from big stock drums.

2. Never use too little. Poor running, strange squeaks, knocks, or grinding sounds from the engine give due warning of this. There should always be about half a tumblerful in the crankcase.

3. Rather less emphatically, never use too much. Over-lubrication causes caking of the rings, piston, valves, and combustion head. But it is infinitely preferable to under-lubrication.

If oiling has been carried to the verge of safety in the direction of economy, you will feel the engine leap away every time a fresh charge is injected. If you never feel the engine respond to a pumpful, probably it is being somewhat over-lubricated, and the frequency of the charges may be cautiously reduced. No rule can be given, as the amount must always vary with the size of pump used, the temperature of the atmosphere, the qualities of the oil, and the speed of the driving.

Tests for oil.—Heat to 400° over a Bunsen burner. If any residue in twenty-four hours the oil is a very good one. For purity, leave oil on a burnished copper surface for two days; if no green stains result, it is free from acid. For dirt, strain a portion. For viscosity, place samples on a flat sheet of glass, and heat its under side. The oil that spreads farthest is the most suitable, but the flashpoint test with a Bunsen burner should precede this test. In general, any oil contained in sealed cans bearing name of a known and reputable maker will be safe.

SPECIAL LUBRICANTS.

For magnetos, gas engine oil.

Chains, grease and graphite mixed, applied to a clean chain.

Machine bearings, any good cycle oil.

Tricar wheels, stuff with grease under caps. Fill rear wheel with grease, supplement with cycle oil.

Gearboxes, engine oil or gear grease, alone or mixed, as recommended by makers.

Water pumps, thickest grease.

Contact breakers, drop of cycle oil on all cams occasionally. Some wipe contact breakers should run in grease.

Magneto drives, grease when dismantled; most drives obtain their lubricant from the engine.

Leather belts, dubbin, engine oil, or any special dressing.

Clutches, collar or castor oil, allowing time to soak.

Free wheel, flush with paraffin, oil with cycle lubricant.

Tyre covers and valves, French chalk.

Pump piston washers, vaseline or grease.

(To be continued.)

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Repairing Petrol Tanks. Steep Hills.

[3411.]—Seeing some discussion on the exploding of petrol tanks while attempting to solder same, I may say that the only safe way is to proceed as follows: Empty out petrol, fill up quite full of water, empty out, and then one can solder without any danger of an explosion.

Re letter 3389. The hill is called White Down Hill, and, in my opinion, it is impossible to climb it (minus pedals) without a two-speed gear. I thought Coast Hill on the Dorking Road was much steeper than 1 in 12. I should have thought it was more like 1 in 4 or 5 in one place. Trusting there will be a competition at White Down,

D. REFFELL.

The Folly of it.

[3412.]—You do publish some rot in your paper, the latest nonsense being to advise people that the Stanley belt fastener (see page 523) can be used to lengthen a belt. The difference in lengths of the three sizes is only $\frac{1}{4}$ in. How long do you imagine a new belt will be stretching $\frac{1}{4}$ in.? If you give advice, give sensible advice.

Plymouth.

The fastener in question allows the belt to be shortened $\frac{1}{4}$ in., as it must be obvious to anyone except "F. G. S." that more than one hook can be used. When our correspondent has mastered this, we should recommend him to learn by heart, "The man who asks questions should ask sensible questions, and ask them civilly."—Ed.]

Handle-bars Working Loose.

[3413.]—Having lately had a nasty fall through being sent away from a repair (?) shop with a loose handle-bar, may I ask why such an unmechanical device as a friction grip for such a vital part of a motor (or any other) cycle is persisted in by manufacturers? To how many motor cyclists has it occurred, I wonder, as to what would happen were their headstock gripping bolt to carry away suddenly while riding. As this bolt frequently serves also as the top bolt of girder forks, and is as such subject to great vibration, this is an ever-present possibility. Cannot the down tube of handle-bars be made D section, the fork tube to correspond? then nothing short of pulling the handle-bars bodily out can render the forks independent of the handles. Since my accident I have had a $\frac{1}{4}$ in. bolt put through headstock and both tubes.

BS 31.

Leaking Batteries and Leather v. Rubber Belts.

[3414.]—If your correspondent, Mr. R. N. Morley [letter No. 3397], will try a couple of E. P. Richford's (Holborn) unspillable accumulators I think his troubles will be at an end. If he cares to do so, he may put them in his tank upside down, but he will get no acid trouble. Unlike most of the unspillable type, they contain no jelly. I have had two in use for some considerable time, and find them excellent.

I have also been much interested by several epistles lately, re slipping rubber belts, also fasteners pulling out. Strange to say, I am now using my fourth Stanley Dermatine, and have never experienced either of the above defects. How many of the grumblers have a perfect 28° pulley and an engine that does not liberally oil the belt? It is astonishing how many motor cyclists try to run rubber belts on worn out pulleys and then condemn them if they slip. My machine is 4 h.p., 160 lbs. weight, and myself 13 st., belt $\frac{1}{4}$ in., but that does not make it slip in any weather. I have no doubt "Jupiter" is in his element fining up greasy, filthy leather belts, but still I prefer to remain

ONE OF THE KID-GLOVED BRIGADE.

Front Wheel Stands.

[3415.]—I enclose sketches of a "front wheel" stand which works under the crank case, as in "Ixion's" Brick-bat. The first drawing shows the stand out of action, held up by a clip. The second sketch shows the front view of the stand in action.

F. W. B. WALTON, R.N.

[3416.]—Judging by the remarks made by "Ixion" and others in your very interesting paper, it appears that there is no front wheel stand supplied by the makers of motor cycles. This may be so of the general run of machines, but does not apply to the Roc, the arrangement adopted in this machine being, in my opinion, ideal, combining as it does a back and front wheel stand. Briefly, the footrests act as supports, and when the machine is allowed to rest on the footrest, it is so beautifully poised that both wheels only just touch the ground, and can therefore be easily revolved. A puncture is thus robbed of half its terrors, and I would suggest that long footrests fitted to other makes would overcome the need for either front or back stands, as in the case of the Roc.

(Dr.) CLARENCE BEESLEY.

[As we have previously pointed out, the only objection to long footrests is their liability to touch the ground when turning corners sharply. We refer readers to "Ixion's" Comments this week.—Ed.]

[3417.]—I notice that in a recent issue of *The Motor Cycle* you draw attention to the convenience of a stand for the front wheel of a motor bicycle. I think, therefore, you will be interested in the accompanying photographs, which represent a device I had made for me more than two years ago. As you will see, it is a combined mudguard stay and stand, and it is extremely satisfactory in use. When the stand is required to be used, it is merely necessary to remove the butterfly nut, when it can be swung down, and will raise the front wheel clear of the ground.

AH 202.

Hills and Hill-climbing.

[3418.]—I have been reading with interest the correspondence in my pet paper about hills and hill-climbing. Not long ago it was Glen Finnart and Rest and be Thankful. I have just returned from Scotland, where I was racing on the 27th of last month at the Celtic Park Track. During my stay in Glasgow, I was driven up both the hills on Mr. E. H.

Bostock's 60 h.p. Daimler car, and must confess they simply astonished me. Both are perfect terrors, and I feel almost certain no single-cylinder machine could climb either of them. On Rest and be Thankful there are three hairpin bends, the one at the top being the worst; and on the steepest part, should anything fail on the machine on this bend, heaven help the rider—the drop is hundreds of feet into the valley. The road is very narrow and in a shocking condition the whole way up. Glen Finnart is short, but like the side of a house, the road also being in a shocking condition. I should like to see some of our hill-climbing champions having a shot at these; they would open their eyes and make them think. Cross Sutton Bank out—it's a pimple. When I hear of a rider getting up these, I will find him another much worse, that Harry Lauder has named "Trust in the Lord."

T. A. CARTER.

A Problem to be Solved.

[3419.]—Referring to Mr. E. L. Ovington's experience, I quite agree with Mr. H. Hill, and not to obtain the "abnormal" running to me means that the carburation and spark position and also exhaust lift are not adjusted correctly. It takes some miles to obtain it, because the correct position of air, gas, and spark levers has to be obtained, according to the atmosphere, but once obtained it "roars" in this "abnormal" way all day.

DC 74.

[3420.]—I have read the interesting letter of Mr. E. L. Ovington, also the answer submitted to it. A footnote from the Editor reads, "Does the extra lubricating oil participate in combustion and propulsion at very high temperatures?" In my opinion this is the cause of the abnormal running of the Big Four, and also many other engines that suddenly develop greatly increased power from some unknown cause, and in some cases "go on their own" with the current switched off. This is put down to dirty cylinder, etc., but

caused this? There being no gas, it must have been the surplus oil. To prove this, I allowed the engine to "abnormal" again, and it ran for several minutes with gas and light (spark) off, and the explosions occurred every time till all the oil was consumed. After this the automatic lubricator was altered, and the engine has never "bolted" since. Perhaps exception may be taken to this being a gas engine experience, but the Editor's note was sufficient for me to see that something of the same sort had really occurred with a petrol motor.

In conclusion, may I say a few words about the many wonderful hills Mr. Barker, Mr. W. Percy, and others have just discovered. Clay Bank, mentioned by Mr. Barker, should be carefully avoided. I was over it last week, and it was a mass of stones, not even the usual six inches in the gutter to wheel your machine. Probably it would take two Clay Banks to make one Sutton, and then not reach a 1 in 4 grade on it. This should be a condition of your correspondent's "What is the state of the hill; is it rideable?" Not invite riders to a hill that is in the state Clay Bank is at present.

W. GOULD.

[3421.]—In looking over your June 17th issue, I notice my letter which I wrote you with regard to the peculiar phenomenon which takes place when I operate my F.N. Big Four motor cycle under certain conditions. At the end of the letter I see the following sentence by your Editor: "Does the extra lubricating oil participate in combustion and propulsion at very high temperatures?" That is a phase of the problem that I acknowledge I never considered. Come to think of it, however, I think it is very probable that at exceedingly high temperatures the oil is decomposed, and on this account there is an abnormal quantity of carbon in the explosive mixture, to say nothing of the hydrogen gas liberated. In this manner a large number of heat units would be liberated in the cylinder upon explosion, and owing to the fact that the temperature is high, the explosion would take place with greater rapidity than under normal conditions. In other words, we not only would have more actual fuel in the cylinder, but we would be able to use more of the energy of the exploding fuel as mechanical energy and less as heat energy owing to the fact that the mixture would be fired almost entirely at the top of the stroke instead of burning comparatively slowly.

I await with interest other suggestions as to the cause of the peculiar phenomenon I have observed.

New York.

EARLE L. OVINGTON.

The Balancing of Motor Cycle Engines.

[3422.]—Some time ago there was some correspondence in your journal on the question of the balancing of motor cycle engines. Please let me add my experiences.

At present I ride a 7-8 h.p. twin Minerva, having previously had a 4½ h.p. twin of the same make, also a single 3½ h.p., and what I want to try and prove is that the twin is somewhat overbalanced, so to speak, the balance weights on the flywheels being too large for the light pistons and connecting rods.

On my last machine I had occasion to fit new pistons and make them heavier than the usual patterns. On my present machine I have drilled three ⅛ in. holes right through the balance weights, close up to the rim of the flywheel. The result in each case has been to make the engine run more sweetly, especially in the latter case, where there seems an increase of speed in the normal running of the engine and distinctly less vibration (which also means more power) at all speeds.

The reason why I did this was because I noticed, when the cylinders were removed from the crank case, the pistons would rise up of their own accord. Now from my small amount of technical knowledge I know this ought not to be the case; if anything, the pistons should just be able to slide down to their lowest position. In the former case we get complete balancing of the vertical piston motion, but leaving a large unbalanced couple which tends to set up vibration horizontally. This accounts for the clattering noise at high speeds.

In other details the engine is beautifully designed, and for reliability it takes a lot of beating. I should be glad of a few replies or criticisms anyone has to make, and I should like to state in finishing that I think one of the chief reasons for the Rex Co.'s successes in hill-climbs is the almost perfect balance of their engines.

T. F. COX.

The coupling shown is a "Unito," made of flat steel strips. One is placed to hold both front wheel hubs together, another to hold both back wheel hubs, and the other two hold the head and the down tubes. There are joints which allow for lateral movement. The couple, or should we say the coupled, had ridden from Sheffield to Lincoln via Newark the day our photograph was obtained.

extra lubricating oil is the moving spirit in this "frivolity." Some years ago we had a gas engine which, to quote "Ixion," took the bit between its teeth, and bolted. The rate that engine ran (and it had governors, of course) was terrific. The gas was cut off, but to no purpose, and it continued running at this speed for several minutes. I determined to find the cause of it, and nothing was allowed to be altered. For several days nothing amiss occurred. Then I noticed that when the engine was hot and driving heavily an explosion would occur, but no gas was taken in for it. What

The Practical Touring Machine.

[3423.]-I notice a letter in your issue of July 1st from "A Member of the P. and D. M.C.C." which interprets a note of mine in a way I never intended. As a matter of fact, owing to sundry causes, and principally to the abnormal nature of the run, the turn out was only six, not two, as he states. However, my idea was solely to get some of our English friends to try the hill, and, of course, let us know how they get on, through your columns. I hope for the reputation of the P. and D. M.C.C. that "A Member" will help to swell the numbers at the remaining runs of this season. ES 186.

Two Twenty-four Hour Runs in a Week.

[3424.] Reading the paragraph on the above matter, I agree with you that the two events coming so close to each other are bound to suffer from want of entries, and, to make matters worse, both runs are practically over the same course. To make both events successful, there should be, in my opinion, at least a month or six weeks between the two. I know of a dozen or so men who are very anxious to enter for the two runs, but who will not be able to do so unless the dates are altered. As the Land's End and back date was fixed weeks ago, it seems reasonable that the A.C.U. may alter the Plymouth date. A 746.

Tyre Troubles.

[3425.]-I was much interested in Mr. W. T. Walton's letter about tyres. I have had an extra heavy tyre go in exactly the same way, having ridden it about 1,000 miles. I sent it back to the makers, and they have sent me a new one free of charge. The tyre was a 26x2½ Modèle de Course Continental. I think that if the British firms were to treat their customers as fairly as I have been treated, the demand for foreign tyres would diminish greatly.

There is no doubt that one-gallon cans of petrol are badly wanted. I was asked 1s. 4d. for a gallon of petrol in Southport the other day, when the price is only 2s. for a two-gallon can.

A police trap is in operation for a quarter of a mile through Carnforth on the North Road; in fact, the whole of the way from Preston to Carnforth it is well to keep to the legal crawl. 6-7 H.P.

[The Lightweight Question.

[3426.]-The enclosed photograph is that of a specially designed motor bicycle for town work made for me by Mr. J. Langham, of this town (Leicester). The weight is 87 lbs., and this would have been further reduced but for the fact that the streets in the district are very "bumpy." The engine is a 2 h.p. Minerva, Brown and Barlow carburetter, with handle-bar control (the only lever not on the handle-bar is the spark advance). The petrol tank holds half a gallon, and the accumulator, coil, and oil tank are as small

as possible. Low frame, large size pedal bicycle saddle. Bates's special tandem tyres 1½ in., the tubes filled with Miraculum. The machine is very handy, fairly fast, and a splendid hill-climber. In view of the strong feeling in favour of the lightweight just now, I thought the above particulars and photograph might be of interest to some of your readers.

W. MOFFAT HOLMES, M.B.

Suggested Meet of Motor Cyclists near London.

[3427.]-In reply to Mr. H. Vowler *re* the above matter, this club—the Eastern District—has already under consideration a joint run of this sort, and his club has been invited to participate in the same. Doubtless his secretary will give him all particulars, and it only remains for him to again get his members to join hands with us, as they did last Sunday week at our president's house at Burford Bridge. This was voted a most successful run, and from reports to hand I think all enjoyed themselves very much. Several other clubs have also been invited (north of the Thames), and I shall be most happy to give club secretaries all information necessary if they will write to me direct at 92, Bromley Street, Stepney, London, E. I should like to arrange the meeting of the hon. secs. and representatives on the 15th, but arrangements already made will stand good for that date, and a further meeting can take place later.

CHAS. STEWARD.

The Kid Gloved Brigade.

[3428.]-In *The Motor Cycle* last week, under the heading of "Belt Fasteners," "Jupiter" speaks of rubber belts as things for the "kid-gloved brigade." I will pass his comments on the relative merits of leather and rubber belts, as I judge from the tone of his letter that he is one of these oily individuals, who not only has his engine, but his hands as well covered with grease, which, of course, is quite detrimental to a good rubber belt. As for the kid-gloved brigade, if there were more members of this force motor cyclists in general would create a far more favourable impression than they do at the present time. A great many riders realise this, and when they dismount at the end of a trip and remove their mackintoshes or dustcoats and overalls, as well as their "kid gloves," no one would ever suspect for a minute that they had possibly been riding 200 or 300 miles through dust or rain. Thank goodness, the motorist who dons the leather coat and leather breeches, dirty leggings, and goes about with no gloves and dirty hands is fast disappearing. I think if "Jupiter" would only compete in one of the 1,000 miles competitions and see the neat appearance of the riders when they finish their day's journey, he would feel rather inclined to join what he terms the "kid-gloved brigade." PS 5.

Business Methods.

[3429.]-Having, like many another motor cyclist, suffered from the amazing indifference and slack business methods of some motor cycle firms, with the consequent annoyance and inconvenience, it is with peculiar pleasure that I ask you to give publicity to the prompt and satisfactory way in which I have recently been treated by two well-known firms.

I was desirous of exchanging my old mount for a lightweight F.N., and wrote to Wauchope's for terms. These were sent per return of post. I then sent my bicycle and cheque away on a Tuesday afternoon, and on the following Thursday I received an acknowledgment, and the assurance that the order for the new machine had been placed with the F.N. Motor Agency with a request for early delivery. To my delight, on Friday afternoon the new bicycle arrived from the F.N. people, but, unfortunately, the lower cover for the ball head had by some means been broken. I wrote to the F.N. Agency on Friday night, and on Sunday morning received another cover free of charge.

Taken altogether, I should think this is almost a record for prompt and courteous dealing, and certainly speaks volumes for the two firms concerned, and of their desire to please their customers.

I have had several rides on my 1½ h.p. F.N., and am delighted with it. The spring forks are excellent, and the hill-climbing capabilities of the machine most satisfactory, while its manageableness and the ease with which it can be started by pedalling must appeal to that class of riders who, like myself, are nearing life's meridian.

I suppose I must add that, unfortunately, I am not interested in any way in either of the above firms.

I would just like to add that I parted with my old 1906 Rex with real regret, and it was only its weight that induced me to do so. For reliability, the machine had no superior, and for this reason had the Rex Featherweight been equipped with spring forks I expect that would have been my present mount. AA 1376.

"SUCH RESULTS SPEAK VOLUMES"

for

DUNLOP QUALITY

Mr. M. W. Randle, of 7, Lawrence Lane, Cheap-
side, writes under date of July 1st, 1908:

"For precaution's sake, prior to starting on the End-to-End run, I am going to re-tyre my '10 Lagonda' tricar; but I have had such fine results out of the present front tyres that I don't like changing them,

**NON-STOP
CERTIFICATE
IN THE A.C.U.
QUARTERLY
TRIALS.**

but must do so, to be on the safe side, and I'm wondering if it will interest you to have their record. I put them on in the early spring of last year, and drove them 1,200 miles, taking the Non-stop Certificate in the A.C.U. Quarterly Trials, a clean sheet

**SILVER CUP
ESSEX M.C.
200 MILES

AND

RELIABILITY

are prominent features in every model from the $1\frac{1}{4}$ h.p. Lightweight to the 6 h.p. Twin, bearing the name of the famous

N. S. U.

Here is our proof:

SUNDERLAND AND DISTRICT M.C.C. Reliability Trial
for the Vaux Challenge Cup, July 1st, 1908.

The course was from Sunderland to Doncaster *via* Stockton and Thirsk, a distance of 220 miles. Marks were deducted if competitors were a minute or more before or after schedule time. The winner finished on a 4 h.p. N.S.U. without losing a single mark.

NEWCASTLE AND DISTRICT M.C.C. Non-stop Run,
June 29th, 1908.

This trial was contested over a very difficult and hilly course of 75 miles. Each of the six N.S.U. competitors made a non-stop run, leaving only five others out of the total number to compete in the final.

It's worth your while to write us about that new machine you intend to get. Every model in the splendid range of N.S.U. mounts has an enviable reputation behind it.

OCCASIONAL COMMENTS.

By "IXION."

Which Side to fit Sidecars.

Whether to fit a sidecar on the near or off side of a motor bicycle is a very delicate question, on which readers' opinions would be interesting. On the one hand, the left-hand position is preferred by many riders, because they are accustomed only to mount from the near side, and cannot mount from the off; but this method of fixing puts the passenger closest to oncoming traffic, and when wheel-shavers are about he—or more often she—does not like it. On the other hand, the near or left-hand position, while preferred by the passenger, makes it awkward for the driver to mount until he has had considerable practice, and also renders the belt and magneto contacts slightly less accessible. While I loathe having to mount from the off side, I hold that the passenger's nerves are the vital factor to consider, and so recommend that the sidecar should be set on the near side, and that the driver should take a push-bicycle and practise the off side mount with it.

Ideal Footrests.

Riders' ideas of footrests vary extremely, and no one seems to know exactly what is desirable. I have this year used on long runs a great many varieties, ranging from fixed and sprung footboards to pedals swinging on a fixed axis, aluminium plates, 2in. wide, and rubber covered, and plain steel spindles $\frac{3}{4}$ in. in diameter. The sort I especially dislike are the plain steel spindles. They are well enough for a short run, but the sensation they create on a really protracted non-stop is most peculiar. They feel narrow and sharp and hot against the hollow of the sole, and after a hundred miles or so one feels as if one's feet were resting against a narrow skewer, and as if that skewer were red-hot. I almost equally detest footboards, as one's feet never seem firm on them, and one cannot fidget about. I think, on the whole, I like the ordinary pedal, as used for the pedalling gear, but threaded on a fixed spindle instead of being attached to pins on pedalling cranks. With these the foot does not slip about, and yet its angle can be varied a little.

Carriage of Spare Parts.

I saw last week a heavy tourist mount fitted by a mechanical owner with a host of minor refinements, and amongst the details I was most impressed by the arrangements made for carrying spares. His tank clips were extended right round the tank, and gripped the middle bar of the frame, as well as the top rail. They were three in number. The front one was extended on each side into a tongue bracket for the carriage of a light generator. The two hinder ones each held a metal strap loop, so that on each side of the tank he carried a small toolbag, scarcely larger than the ordinary push-cycle size, these being held off the tank by the encircling bands of the clips. In one he had his spare valves, each packed in a little Selvyt case; in the

other six spare sparking plugs, also encased in wash leather. Such details make it impossible for the weight of the machine to be kept as low as is desirable, but they show the pains and ingenuity expended by some enthusiasts to suit their machines to touring requirements. Without going to such complication of structure, I am a great believer in using several small toolbags instead of one large one, and so keeping the fragile spares separate from clumsy spanners.

Clay Bank.

I see a Mr. Allan Barker is inviting motor cyclists to attempt the ascent of Clay Bank, on the Stokesley-Helmsley road. Before readers take the trouble of visiting it, they ought to know the nature of the task. The hill is a pretty straight one, and as far as memory serves me the gradients are by no means excessive. But the surface is—or was—too atrocious for words, resembling thinly spread, unrolled road metalling. There is a water-splash at the foot of the hill, and it is crossed at intervals by stone gutters, intersecting the road at an angle, and provided for cart wheels to rest in while the horses get their breath. The ascent will give no rider any pleasure, and any aspirant to honours upon it should use handle-bar control, and grip his handles as a drowning man clutches a straw. I remember walking down it in preference to riding down, when I was last along that road. It is not far from Sutton, and riders visiting Sutton can easily return down it, and then try the ascent if they want a rough shaking. Near the top the road cuts through an immense landslip, which is worth a visit, and the scenery, as a rule, almost compensates for the unspeakable vileness of the surface. Steep hills are plentiful in the district.

Worn Cylinders.

One or two remarks have recently appeared in our columns about the appearance of wear in the light cylinder castings now current, after they have done a couple of seasons' work. I recently took down the engine of a 5 h.p. twin, which has done about 10,000 miles with a two-speed gear and sidecar. On calliper-ing the cylinders, I found the upper part of the bore enlarged to the extent of about 2 mm. To renew these cylinders would cost about £2 10s.; to bore them out evenly to an extra couple of millimetres would entail the purchase—and probably also the manufacture—of a pair of new pistons, and would leave the cylinder walls too thin for the heavy work they have to do. Consequently I am making no replacements at all except to procure six new piston rings, with which I confidently expect to restore the power and the compression to their ancient efficiency. I will let readers know how I succeed, but even if this method proves to have sacrificed a trifle of power, its extremely low cost recommends it for general adoption.

CURRENT CHAT.

Special Features

Contact Breakers for
Twin-cylinders.

London to Edinburgh
on a Lightweight.

The Motor Union and Motor Cyclists.

It is said that the Motor Union is drawing up a prospectus for motor cyclists which will very strongly appeal to them.

The Number of Motor Cycles in London.

367 motor cycles were registered with the London County Council from March 1st to April 30th, bringing the total number of motor cycles registered in London to 8,508.

The Auto Cycle International T.T. Race.

The Four Inch Race for cars has been announced to take place in the Isle of Man on September 24th, and it is practically certain that the Motor Cycle T.T. Race will be held on the 23rd of that month.

Motor Cycle Imports.

146 motor cycles were imported last month of the value of £6,424 with parts, as against 158 in June, 1907, of the value of £8,031 with parts. The half-yearly figures from the Board of Trade returns show that, although the imports of foreign machines are a long way in advance of the British exports, a less number of foreign motor cycles are being brought into England every year. The import figures were:

1906	1907	1908
1,249	1,142	908

Value with parts—		
£50,994	£49,637	£36,207

British Exports.

The June exports of British motor cycles totalled fifty of the value of £2,839 with parts, as compared with thirty-one machines in the corresponding month of 1907 of the value of £2,508 with parts. At the end of the first six months of each year the export figures were:

1906	1907	1908
360	330	390

Value with parts—		
£26,556	£26,132	£24,485

Re-exports of Foreign Motor Cycles.

Twenty-three motor cycles of foreign manufacture valued at £709 and £3,725 worth of parts manufactured abroad were re-exported from this country during the six months ended 30th June.

Rear Lights.

At the annual meeting of the Birmingham Motor Cycle Club the following resolution was passed: "That in view of the danger to road users from vehicles being insufficiently lighted, and as a practical move in the right direction, it be a strong recommendation to every member of the club to carry a red rear light on his machine."

A.C.U. Council Meeting.

The next council meeting of the A.C.U. will be held at Warwick on October 3rd. Warwick is well situated for the purpose, being in the Midlands and approachable by excellent roads from all quarters.

A.C.U. Penalty Run.

It has been decided to hold a penalty run over Essex roads for members of the A.C.U. and clubs in the South of England districts affiliated to it. The entrance fee will be 3s., and competitors will be fined 1s. per stop. The maximum amount exacted in fines will be 5s. Competitors making non-stops will be awarded bronze medals, and there will be a prize for the best performance of a team entered by any club of the value of two guineas. The event will take place in the autumn.

Cissac's Fatal Accident.

That world-famous motor cyclist, Henri Cissac, met with his death in the Grand Prix Race on Tuesday of last week. He was driving one of the huge Panhard racing cars when one of the rear tyres burst, and the car turned turtle, pinning Cissac and his mechanic Schaub to the ground. Both were unfortunately killed. Cissac was the

motor cyclist who created such a stir by his wonderful speed performances at Brighton and Blackpool in 1905, riding a 14 h.p. Peugeot. At one time he was without doubt the most expert motor cyclist in the world. Several of his records still remain unbeaten, notably the one for the fastest speed ever accomplished on a single track machine. In the 1906 Tour de France Reliability Trial, he was the only rider to finish without the loss of a single mark.

Further Medal Winners in the L.-E. Run.

The following additional names have been passed for awards in the London-Edinburgh twenty-four hours' run at Whitsuntide: Gold medals—W. Adam, H. G. Bell, A. Carpmael, jun., H. C. Hanrott, W. Pratt, and P. H. Trotman. Silver medals—H. G. Cove, F. Mussell, J. H. H. Robinson, and C. Truscott.

Twelve Hours' Reliability Trial.

The following riders obtained full marks in the Edinburgh and Glasgow M.C.C. twelve hours' reliability trial on June 27th: R. G. Bostock, Gordon Gibson, J. L. Thomson, J. A. Forrest, C. B. Fergusson (all on 3½ h.p. Triumphs), H. H. Simpson (5 h.p. Vindec), and J. McDuff (2½ h.p. Tee Bee). C. H. MacMillan (5 h.p. F.N.) lost seven marks. The event was most successful.

Police Traps.

There is a police trap between the Marquis of Granby and Lewisham.

There is also a trap on the Brighton Road extending from Streatham Church to the railway station.

A police trap is in operation at weekends on the main road between Gomshall and Shere, two villages lying between Guildford and Dorking.

We have also received information that the park-keepers in Richmond Park are very active, and stop all motorists who exceed the ten miles per hour limit.

Near Polhill, on the Sevenoaks Road, motorists are being stopped and requested to show their licenses. Far from being done with the police after this interruption, they are timed over a measured distance as soon as the interview is over.

We have received news of a police trap between Robertsbridge and Battle, Sussex. The trap begins from the first publichouse on the left, and extends to the railway crossing (in the direction of from London to Battle). The trap is worked both ways and on Sundays. Every motorist is stopped and asked to show his license.

Scotland is also by no means free of police traps, as we hear that the police are very active in the neighbourhood of Banff. A correspondent informs us that the best road from Huntly to Banff is *via* Rothiemay Station and the village of Cornhill, and not by the village of Aberchirder, as the part (nine miles) from Aberchirder to Banff is in a most disgraceful condition.

Reliability Trial in England and Scotland.

The Newcastle and District M.C.C. will hold its annual 400 miles reliability trial on August 2nd and 3rd over a course in the North of England and South of Scotland.

The Land's End to John-o'-Groat's Trial.

The following members of the A.C.U. consented to act as judges, Messrs. A. G. Reynolds, J. W. G. Brooker, A. Sharp, and H. G. Cove. Messrs. Reynolds and Brooker will travel over the whole course, and both are veteran A.C.U. officials. Mr. Brooker has never missed an A.C.U. trial since 1903, and Mr. Reynolds, who attended his first A.C.U. 1904 1,000 miles trials as a competitor, has been through every other similar event as a judge, following two complete trials on a motor bicycle. Mr. Reynolds's services to the A.C.U. have been invaluable, and the amount of purely honorary work he has done for the Union has been nothing short of phenomenal. Would there were more like him.

Motor Bicycles "Hop Along."

At the Blanchardstown (Dublin) Petty Sessions recently, Mr. Alfred St. John Kennedy was summoned for driving a motor bicycle at a speed of thirty miles per hour. Mr. Tobias referred to the machine as "one of those things that hop along like a sheep." Mr. Kennedy was fined £1.

Trapping After Dark.

The credit (?) of introducing trapping by lantern light belongs, we understand, to the authorities of Lee and Eltham, S.E. The trap is worked both by day and by night, is one furlong only in length, and is in the Eltham Road, S.E., between Lee Green and Eltham.

Condition of the End-to-end Route.

A reader who has just completed a tour from Cardiff to John-o'-Groat's informs us that the roads from Inverness to John-o'-Groat's are in good condition right up to Alness, but at Dingwall there are "drive slowly" notices through the town. After Bonar Bridge the road is in good order until the vicinity of Dornock, where there are three or four miles of really rough road. The other side of the mound (about two miles) the roads were being metalled last week. On to Helmsdale the surface is good, and across the Ord is fair with some loose parts. Berriedale is in good order. The rest is plain sailing.

Portmarnock Speed Trials.

Owing to the weather turning out so badly on Saturday last, the 11th inst., the speed trials of the Motor Cycle Union of Ireland, at Portmarnock, have been postponed to Saturday week (July 25th), and will be run in conjunction with the fixture of the Dublin and District M.C. Club on that date.

Police Methods.

Two Finchley motor cyclists appeared at Welwyn on the 10th inst. to answer summonses for riding in a manner dangerous to the public at Welwyn on

May 31st. The police evidence was intended to show that the defendants drove their motor cycles at a speed of between sixteen and twenty miles per hour down the hill from the direction of Stevenage into Welwyn. The defendants, on the other hand, contended that they not only came down the hill with all care, but actually stopped on the way down, because a number of

Another Police Trap.

On the London-Eastbourne Road, about two miles beyond Uckfield. This is a long-distance trap, and works right into Eastbourne twenty miles away. Riders should turn off at Willington and travel *via* Hampden Park.

The Need for a Change Speed Gear.

The issue of the *Scottish Cyclist* of the 8th inst. contains a very sensible leading article on motor cycle touring. It states that touring on a motor bicycle is not so popular as it might be. This seems to us to be hardly correct, as a large number of motor bicycles are to be seen touring on English roads at any rate. However, the remainder of the article points out in a very lucid manner the importance of having a machine fitted with a two-speed gear, since it opens up the whole of the country for the motor cyclist. The Highlands of Scotland adequately serve to show the importance of fitting a machine with a change-speed gear of some sort. The steep hills with their severe corners cannot be taken at a rush, and anyone who has been through the country would easily realise that unless a change down is possible, these corners cannot be negotiated. Anybody who has any doubts on the subject should refer to the *Scottish Cyclist* of the 8th inst. *The Motor Cycle* has constantly advocated the use of a change-speed gear, but they are not likely to become universal just yet, as cost, complication, and reliability are all against variable gears.

FUTURE EVENTS.

- July 13-18—A.C.U. LAND'S END TO JOHN-O'-GROAT'S SIX DAYS' RELIABILITY TRIAL.
 „ 14-15—M.C.U.I. (Ulster Centre) Open 400 Miles Reliability Contest.
 „ 18—London and South Western Bank Five Miles Motor Cycle Race at Herne Hill.
 „ 18—Gymkhana at Birmingham (two open events for motor cycles).
 Aug. 3-4—Motor Cycling Club Run to Land's End and back for Charles Jarrott Cup.
 „ 7—A.C.U. 24 Hours' Ride, London to Plymouth and back.
 „ 8—Essex M.C. Open Race Meeting at the Stadium.
 „ 15—Coventry M.C. Open Hill Climb for Motor Bicycles and Passenger Motor Cycles.
 „ 22—A.C.U. Annual Race Meeting at the new Stadium, Shepherd's Bush.
 „ 29—Essex M.C. Open 200 Miles Non-stop Run for Motor Cycles.
 Sep. 12—Motor Cycling Club Petrol Consumption Tests.
 „ 23—The International Auto Cycle Tourist Trophy Race in the Isle of Man.
 „ —Penalty Run for Members of the A.C.U. and Clubs in the South of England Districts affiliated to it.

children were playing on the roadway. The hearing lasted one hour, and a fine of 20s. including costs was imposed.

Some of the End-to-end competitors at Land's End on Saturday. Most of the others did not arrive at Penzance until Saturday evening.

START OF THE END-TO-END RUN.

Penzance, July 12th.

WE arrived here this morning by train in company with several officials and competitors who had been unable to leave London earlier.

Though dull, the morning was fine, and by 10 a.m. a large number of riders had congregated on the quay outside Taylor's Garage, where their machines were sealed and inspected by the officials until lunch-time. Judges, marshals, and competitors worked with a will, the former sealing the frames and cylinders, and taking voluminous notes, the latter giving endless information about their respective mounts. The notes referred to were obtained by filling up a card stating every conceivable detail concerning the machine, such as weight unladen, weight of the rider, weight of luggage and accessories, dimensions of engine, size and make of tyres, make of belt or type of transmission, nature of ignition, type of brakes, etc. In this way, the valuable facts concerning the machines have been accumulated. Up to the present time almost all the riders have made an appearance. B. H. Davies is

heavily. The names of those who were duly despatched on the 893 miles run are:

M. W. Randle (10 h.p. Lagonda tricar), W. H. Wells (5 h.p. Vindec Special), W. Ridler (6 h.p. Leader), E. Nelson (5 h.p. Rex), J. Tassell (3½ h.p. Matchless), S. W. Carty (3¾ h.p. N.S.U., two-speed), A. D. Nicholson (3½ h.p. Triumph), Gordon Gibson (3½ h.p. Triumph), F. Dover (3½ h.p. Triumph), F. S. Barnwell (3½ h.p. Rex, two-speed), H. R. Mayo (5 h.p. Vindec Special, two-speed), M. Geiger (6 h.p. N.S.U.), T. F. Cox (7 h.p. Minerva), F. C. Mustard (3½ h.p. T.T. Triumph), C. E. Murphy (3½ h.p. Triumph), W. H. Outwin (3½ h.p. Triumph), Miss Muriel Hind (5 h.p. Rex), E. Gwynne (5 h.p. Vindec Special, two-speed), W. W. Douglas (2¾ h.p. Douglas), P. Phillips (2¾ h.p. Douglas), Eli Clark (2¾ h.p. Douglas), R. W. Duke (3½ h.p. Triumph), H. C. Hanrott (3½ h.p. Triumph), A. Manning-Lomax (3½ h.p. Triumph), G. Lee-Evans (3½ h.p. Rex), O. C. Godfrey (3½ h.p. Rex), A. J. Sproston (5 h.p. Rex), F. W. Applebee (5 h.p. Rex), J. Slaughter (3½ h.p. T.T. Triumph), J. Marshall (3½ h.p. T.T. Triumph), P. H. Cockcroft (3½ h.p. Triumph), A. H. Ormerod (5 h.p. F.N.), J. O. M. Dixon (3½ h.p. Vindec Special, two-speed), T. K. Hastings (5 h.p. Indian), R. Moore (3½ h.p. Phelon and Moore, two-speed), W. Milnes (3½ h.p. Phelon and Moore, two-speed), H. H. Dommett (3½ h.p. Triumph), Robert King (3½ h.p. Triumph), J. Haslam (3½ h.p.

End-to-end riders
at Penzance
replenishing the
petrol tanks.

perhaps the most noticeable absentee, as through tyre and other troubles he has reluctantly decided not to compete. He is, however, intending to complete the journey as an official. Another well-known rider, who successfully went through the 1907 six days' trial is Ivan B. Hart-Davies, who is prevented from competing by pressure of business. The only passenger machine is M. W. Randle's 10 h.p. Lagonda tricar, which has seen great service. J. S. Shaw, with the Phänomen bicycle and sidecar, has withdrawn, and so have W. H. Bashall (3½ h.p. Triumph), S. H. Richardson (5 h.p. F.N.), and J. G. Blandford (3½ h.p. Zenith). Of those who will actually start we recognised many old friends, notably W. H. Wells, F. W. Applebee, sen. (who has either competed in or else been closely connected with every A.C.U. reliability trial since 1903), E. Nelson (who took part in the End-to-end run of 1906), Miss Muriel Hind, O. C. Godfrey, R. Moore, H. R. Dougal, W. Milnes, White, and others. T. K. Hastings with a brand new 5 h.p. Indian (twin) has just arrived safe and sound from the States.

The official start was made in glorious weather on Monday morning at 8, but soon afterwards rain fell

Rex), Sir R. K. Arbuthnot (3½ h.p. Triumph), Leoffric Cutler (3½ h.p. Triumph), H. Ellison (1¼ h.p. Motosacoche), J. V. Robinson (1½ h.p. Motosacoche), W. F. Merritt (3½ h.p. Triumph), J. Ewing Adam (3½ h.p. Triumph), G. L. Fletcher (2 h.p. Moto-Rêve), W. Smith (2 h.p. Moto-Rêve), C. A. Palmer (5 h.p. Roc, two-speed), W. Newman (4 h.p. Roc, two-speed), A. D. Powell (3½ h.p. B.P., two-speed), H. B. Lewis (3½ h.p. Triumph), A. M. Tatham (3½ h.p. Matchless-Jap), P. Weatherill (3½ h.p. Zenette, variable gear), F. W. Barnes (3½ h.p. Zenette, variable gear), A. F. Wilding (6 h.p. Bat-Jap), A. D. E. Craig (5 h.p. F.N.), H. D. Seale (3½ h.p. Triumph), and H. R. Dougal (5 h.p. Vindec Special).

A fully illustrated description of the trial will be published next week.

Richford and Co. guarantee all terminals of their accumulators to be absolutely non-corrosive, and if any they may have supplied are found to be faulty through creeping of acid, they are open at any time to replace with a brand new accumulator.

In "Occasional Comments" last week, under the heading, "A Magneto Tip," "Ixon" referred to a Simms magneto. We are asked to point out that the magneto referred to therein was a Simms-Bosch, now known as a Bosch.

**Wakefield M.C.**

At a meeting held on the 3rd inst. it was decided to hold the first reliability trial on Saturday, July 25th, starting from headquarters, George Hotel, Kirkgate, Wakefield, at two o'clock. Motor cyclists in and around Wakefield are invited to join in any of the runs.

Manchester M.C.

The second speed judgment test during 1908 was held on Saturday last. The weather was very stormy and wet, with the result that only nine members competed. The course measured between seventeen and twenty miles, and was by way of Mere Corner, Plumbley, Northwich, turning left there for Rudheath Corner, and thence to Lower Peover by the Holmes Chapel, Knutsford Road. Each competitor, starting at intervals, was informed of the speed to be travelled, which varied between fifteen and eighteen miles per hour. Result: Motor cycle section.—1, J. E. Rees, 132½s. fast; 2, Otto Gross, 258½s. slow.

Western District M.C. and North-west London M.C.C.

An inter-club competition between the above clubs took place on Saturday last. The course was a circular one from Gerrard's Cross, a total distance of 100 miles. The opposing members were paired off as near equal h.p. as possible. Any rider making a stop of any sort other than traffic conceded one point to the opposing club. The riders who made non-stop runs and completed the 100 miles were: R. Canham (3½ h.p. Brown), W.D.M.C., opposed to W. G. Barton (3½ h.p. Triumph); H. Vowler (3½ h.p. Triumph), W.D.M.C., opposed to S. Winkworth (3½ h.p. Triumph); F. Ritchie (5 h.p. Rex), W.D.M.C., opposed to H. G. Cove (4 h.p. Jap). The N.W. London M.C.C. won the event by two points. Quite a large number of members from both clubs attended. Thanks are due to Messrs. H. V. Davidson (N.W.L.) and C. N. Gould (W.D.), who arranged the details of the competition.

Essex M.C.

On Saturday last the club held its second annual gymkhana, and although the weather was threatening the rain held off, and the sun showed itself occasionally. The sports were held at High Beech, Loughton, Essex, in one of the prettiest parts of Epping Forest. The ground was prettily decorated with flags, and there was a good number of spectators.

ESSEX M.C. GYMKHANA, JULY 11th.

Event I. was called a plug-changing competition. Competitors had to ride one lap, then stop and place their machines on stands, remove the sparking plug, change it for one in the hands of an official, replace, and ride one lap to finish. Event II. comprised tilting at the rings, lemon cutting, and Turk's head cutting. There were six rings, three lemons, and one Turk's head, which had to be dealt with by the riders. Event III. went under the name of apple bobbing. A row of pails filled with water was placed near the finishing line, and each had an apple floating on the water. Entrants had to ride to a point thirty yards from the finish, dismount and place their machines on stands, then run to the pails and remove the apple with their mouths, then return to machine and ride to finish with the apple still in their mouths. Event IV., potato picking. Competitors had to pick up three potatoes with a net and deposit them in a pail, the rider doing it in the shortest time winning. Event V. was potato changing, and was an event for sidecars and forecars. The passenger had a potato, which he had to change at each of four points on the track. Machines had to come to a standstill at each change, the first one round to be the winner. Event VI. was the same, only for cars with lady passengers. Event VII. was the old game of musical chairs, only on motor bicycles. A small track was marked out in flags on the grass, and riders were started and stopped by the band. Machines had to be placed on stands at each stop. The results were as follows:

Event I.—1, F. G. Smith; 2, R. M. White; 3, A. Curtis. Event II.—1, R. M. White; 2, A. G. Reynolds; 3, F. W. Applebee. Event III.—1, F. W. Applebee, 2, A. P. Howard; 3, R. M. White. Event IV.—1, A. G. Reynolds; 2, F. W. Applebee; 3, R. M. White. Event V.—Frank Pershke. Event VI.—Will Pershke. Event VII.—1, F. G. Smith; 2, R. M. White; 3, A. G. Reynolds.

Immediately after the last event a party left for Paddington, en route for Land's End and the End-to-end run.

The club run next week is an all-night run to Yarmouth, leaving Barnard's Hotel, Chelmsford, at eleven o'clock on Saturday night. Those intending to take part are requested to let Mr. Summers know, so that he can arrange for breakfast at Yarmouth. The captain's address is "Southernhay," Loughton, Essex.

Changing sparking plugs against time. An interesting occupation, especially when the engine is hot!

The musical chairs event for motor cyclists, which caused much amusement.

Club News.—

Hull and East Riding A.C.C.

The reliability run to Scarborough and back was held on Saturday, and there were fifteen starters. The run was most enjoyable. Competitors were met at Scarborough by members of the local motor cycle club, and dined with them at the

Mrs. Thomlinson being started on the Hull A.C.C. Reliability Run to Scarborough and Back last Saturday. She came through the trial successfully.

Pavilion Hotel. Results are not yet announced, but all got through successfully except two.

The Hull club regrets to announce that the chairman, Capt. J. A. Foster, and the late captain, W. G. Pickles, have resigned the club. Mr. E. W. Forward, the hon. solicitor, has been appointed chairman of the club.

A general meeting will be held on Friday, July 17th, at 8.30, at the White House Hotel, to consider the question of removing the headquarters of the club.

Walthamstow M.C.

A non-stop run to Clacton-on-Sea will be held on Saturday next, starting from the Castle Hotel, Woodford, at 3.30 p.m. sharp.

The second trial for the 100 miles cup competition has been arranged for July 26th, starting at 7 a.m. from Thornwood, near Epping. The following members are eligible: Messrs. O. C. Godfrey, F. A. Applebee, J. W. Percival, G. West, A. H. White, L. Beckess, and J. Meads.

Newcastle and District M.C.C.

A handsome cup has been presented by the N.S.U. Motor Co., Ltd., of London, to the Newcastle and District Motor Cycle Club for its annual 400 miles reliability trial, which event is to take place on August 2nd and 3rd over a course in the North of England and South of Scotland. Valuable prizes are also given for second and third places, while gold medals are given to every competitor finishing between minimum and maximum times. A large entry is expected. Any motor cyclist wishing to compete can join the club and take part in this event. Good weather is all that is necessary to make the event one of the most successful in the provinces. The cup is on view in the windows of the Percy Cycle Co., Ltd., Northumberland Street, Newcastle-on-Tyne.

Barnoldswick M.C.

The above club held the first of a series of reliability trials on the 4th inst. The course chosen was Barnoldswick to Gisburn, Hellfield, Coniston Cold, Gargrave, Skipton, and back to Barnoldswick—a rather short, but very hilly course. There were thirteen entrants, and eleven took part in the run. The power of the machines ranged from $1\frac{1}{2}$ to 6 h.p. Seven got through without a stop or loss of marks, which was very good for a first attempt. One special feature of the trial was the splendid performance of the two lightweight machines, $1\frac{1}{2}$ and 2 h.p. Clément-Garrards, both of which got through without stops and made exactly minimum time. The two 6 h.p. machines did not show up as well as the lightweights, both having three stops to record, although making good time. The local bicycle club kindly assisted in marshalling the course. The trial was watched by a crowd of people, and created a very favourable impression. The success of the trial was due to the hon. sec., Mr. F. Baldwin, who acted as timekeeper and starter. The next event will be a hill-climbing competition, on the 21st inst.

Leeds M.C.C.

The second annual invitation run from Leeds to London and back in twenty-three hours was held on Saturday last. All Leeds members were eligible to compete, and invitations were sent to all the premier Northern clubs to send teams of three to try if possible to take the trophy (a thirty guinea shield provided by the L.M.C.C.) from the Leeds members for the year. The following clubs sent teams: Manchester, Middlesbrough, Hartlepool, Bradford, and Barnsley. Sheffield were unable, but hope to do so next year, and Hull, unfortunately, had a competition on the same date. The run was held in conjunction with the Bradford M.C.C. Last year there were two winners, i.e., F. W. Greenwood ($3\frac{1}{2}$ h.p. Rex) and P. H. Cockcroft ($3\frac{1}{2}$ h.p. Triumph). The former ran again this year, but the latter had left Leeds for the End-to-end run. The winner is awarded the shield, gold medal, and certificate; second and third, gold medal and certificate. The club's standard bronze medal will be awarded to all competitors who completed the course in twenty-three hours, and in accordance with the conditions of the trial. In addition to the above, Messrs. Walker and Hall will give a special prize of a valuable solid silver cigarette case to the rider losing fewest marks, who is not in the first three, and who is not in any way connected with the motor cycle trade. Two and a half hours before the start it was raining heavily. The competitors (forty in number) met at the John-o'-Gaunt's Hotel, Pontefract Road, at about 7.30 p.m., and the first rider, G. Horner, was despatched at 8 p.m. Meals, petrol, oil, etc., were provided at the hotels at Newark and Biggleswade on both outward and homeward journeys, and petrol was also procurable at the turning point at Highgate. The results cannot be declared until the various checkers' sheets have been examined, but we hope to receive them in time for publication next week. The names of the entrants were: G. Horner, G. E. Tennant, F. A. Scriven, J. Hoffman, T. Wake, A. Moorhouse, F. C. Bagshaw, A. Barraclough, A. Thorpe, Lacey, T. G. Bullus, H. Wheeler, S. L. Gjertsen, E. Slater,

Leeds M.C.C. Competitors assembling for the 23 hours' run to London and Back.

Tytler, J. A. Leyland, T. Ikin, J. Lawn, F. Abram, B. Siffkin, T. Briggs, W. B. Durant, W. Jowett, A. E. Bagshaw, J. Wild, E. S. Myers, C. E. Kettle, G. MacLouchlan, A. H. Forbes, H. Greaves, H. Shaw, P. Dyett, J. Dale, W. Grinstead, A. A. Scott, F. W. Greenwood, and E. Slater.

Sunderland and District M.C.C.

At the kind invitation of Mr. B. Grimshaw, weather permitting, members and friends will meet at High Barnes, Chester Road, on Wednesday, July 22nd, at 3 p.m., and proceed to Finchale Woods, one of the most attractive beauty spots in the district, to enjoy their annual picnic. Further details may be had by applying to the secretary, T. Jameson, 11, King Street, Sunderland.

The result of the third annual competition for the Vaux challenge cup, run over a course of 220 miles to Doncaster and back, in which three members scored full marks, has now been decided by Mr. Russell Jackson magnanimously retiring, and the committee have agreed to present silver medals of equal value to Messrs. E. J. Tiffin and S. Wilson, the cup to be held in turn by each for a period of six months.

Club News.—

Middlesbrough and District M.C.C.

A 200 miles reliability trial will shortly be held for a gold medal given by Mr. Stanley L Gjertson, also for a Triumph and Rex gold medal.

Eastern District M.C.

Members are requested to put in a good attendance at headquarters at the meeting to-day (Wednesday) at 8.30 p.m. to discuss how the trophy shall be run off. Several new members will be elected. The committee has under consideration a new proposal for making associate members and another joint run.

Newcastle and District M.C.C.

A penalty run under A.C.U. rules (for these trials) was decided on the 5th inst. over the same course as the inter-club competition of last year. The following finished with clean sheets: L. Rosenvinge ($3\frac{3}{4}$ h.p. N.S.U.), D. Mallett ($3\frac{3}{4}$ h.p. N.S.U.), A. D. Nicholson ($3\frac{1}{2}$ h.p. Triumph), T. Smith ($2\frac{1}{2}$ h.p. Triumph), and C. Reinhart (4 h.p. N.S.U.). A number of competitors failed through tyre troubles. The timekeepers were Messrs. Robson Crosier and S. W. Carty; marshals, J. Moule, W. H. Outwin, R. W. Holmes, and W. P. Robinson.

Coventry M.C.

The open hill-climb to be held at Newnham on August 15th. will include five classes, viz., (1) lightweight machines with engines having a cubical capacity not exceeding 350 cubic inches, maximum weight of machine to be 100 lbs.; (2) single-cylinder machines, any size; (3) twin-cylinder machines, any size; (4) open to any touring motor bicycle; (5) passenger motor cycles. No practising whatever will be allowed on the hill. A gold medal will be presented for best placing on A.C.U. formula in each class, and a prize for fastest time in each class. The entrance fee for members is 5s. each event, but if one machine is entered in two events, 7s. 6d. Non-members of the Coventry Club pay double. Standard touring machines fitted with metal mudguards, lamp, toolbag, with tools, and hooter must be used in each case. Entry forms and particulars will be ready in a day or so, and can be obtained from the hon. sec., E. W. Walford, 19, Hertford Street, Coventry.

Blackpool and District M.C.C.

The annual hill-climb was held early this month on the Delph Road, and on time the placings were as follows:

	Time.
{ J. G. Warburton (4 h.p. Roc)	60 $\frac{1}{2}$ s.
{ Dr. Reid ($3\frac{1}{2}$ h.p. Triumph)	60 $\frac{1}{2}$ s.
W. Taylor ($3\frac{1}{2}$ h.p. Triumph)	65 $\frac{3}{4}$ s.
J. Stanworth ($3\frac{3}{4}$ h.p. N.S.U.)	66 $\frac{1}{2}$ s.
Dr. Baker ($3\frac{3}{4}$ h.p. N.S.U.)	66 $\frac{1}{2}$ s.

The results will be worked out on the A.C.U. formula and announced next week.

Mr. Geo. E. Tennant, who was for some time Trials Hon. Sec. of the Leeds M.C.C. He is depicted with his new mount, a 5 h.p. twin-cylindered two-speeded Vlndee fitted with Palmer tyres and Brooks saddle

New Laurin and Klement Machines.

THE Laurin and Klement Motor Agency, 255, Tottenham Court Road, W.C., have lately introduced two fresh models, specially suited to the British public, of their well-known motor bicycles, which have always acquitted themselves well in many Austrian competitions and in not a few held in

bars are longer, and Bowden wire control is used in place of levers and rods. The magneto has a metal cover to protect it from wet and dirt. The other new model is a 5 h.p. twin, the engine dimensions of which are 75 by 90 mm. The carburetter is of the spray type and of large size, and has an automatic

The new pattern $3\frac{1}{2}$ h.p. single-cylinder L. & K.

this country. The $3\frac{1}{2}$ -4 h.p. single cylinder, the engine having a bore and stroke of 80 by 100 mm., is fitted with a Longuemare spray carburetter, a sleeve throttle working in a ratchet, spring forks of exceedingly good design, and a powerful brake working on the rim operated by a long foot lever, in addition to a good hand controlled band brake. The handle-

The latest model twin-cylinder is quite up to date.

air valve. In most other respects it resembles the model we have just described. The engines of both machines are fitted with the well-tried Laurin and Klement low-tension magneto ignition, which is capable of being advanced and retarded. We sincerely hope that these two machines will meet with the success in England that they deserve.

Questions

&

Replies.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used; the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied with a stamped addressed envelope for reply.

Wire Stretched.

? My machine, a $1\frac{1}{2}$ h.p. Moto-sacoche with magneto, continues firing very weakly, but sufficiently to run the machine on level after the exhaust lifter is raised. Can you explain why? I have not noticed it doing this before. There is no doubt but that the exhaust is properly raised, as it works all right for starting.—H.B.B.

The trouble can be easily cured, as it is perfectly obvious that the exhaust valve lifter is not working properly, as were the valve fully raised an explosion could not occur. The wire operating the lifter should be slightly shortened.

Saddle and Belt Slip.

? Please advise as to choice of suitable saddle for $2\frac{3}{4}$ h.p. machine to carry 13 stones weight, and which is low and without the long projecting spring in front. Messrs. Brooks advertise a spring seat, but I understand it is not well suited for pedal work. Is there a cure for belt slipping on my machine, gear $4\frac{3}{4}$ to 1 (19in. and 4in. pulleys)?—K 1144.

There is no better motor cycle saddle than Brooks's B 105, which is specially made for giving a low riding position. The best cure for belt slipping is to see that the belt and the pulleys are of the correct angle of 28° . All first quality belts are made to this angle.

Size of Belt. Effective Silencers.

? My cycle is a heavy $3\frac{1}{2}$ h.p., and the pulley wheel and belt rim will only admit of a $\frac{1}{2}$ in. belt being used, and I find the belt stretches rather much. I have tried both the Lycett (leather) and Dermatine. Could you tell me the best belt to get under the circumstances? As regards a silent silencer, I notice you mention Sharp's in a recent issue. Could you tell me the price of this, and does a quiet silencer cause much back pressure?—A.C., Southsea.

Nothing less than a $\frac{1}{2}$ in. belt will stand for long on a $3\frac{1}{2}$ h.p. bicycle. We should recommend you to obtain new pulleys of the correct angle, viz., 28° . The price of Sharp's silencer can be obtained from the makers. We do not quote prices in these columns. An effective silencer does not cause back pressure provided it is properly designed.

Route from Glasgow to London.

? Would you kindly inform me which is the best route from Glasgow to London for a novice? Time is no object, and I would like to avoid as many towns as possible.—L. McN. W., N.B.

Your best route is as follows: Glasgow, along the Carlisle Road to Beattock and Lockerbie. At Gretna Green turn to the left and proceed through Longtown and continue through Brampton, Alston, Middleton-in-Teesdale, Barnard Castle, Boroughbridge. This lands you on to the Great North Road, which you follow through Wetherby, Aberford, Doncaster, Retford, Newark, Grantham, Stamford, Stilton, St. Neots, Biggleswade, Baldock, Welwyn, Hatfield, Regent's Park, and London.

Paraffin Tap and Care of Rubber Belts.

? (1.) There is no device for injecting paraffin into cylinder of my motor cycle. Ought there to be one? (2.) Do rubber belts require any dressing, and should they be left on the pulleys at night, or does this strain them?—L.R.

(1.) Undoubtedly a means of injecting paraffin would be an advantage. Probably you could fit an ordinary lubricator cap into the induction pipe immediately over the inlet valve, which will serve the purpose of a "compression tap." (2.) Rubber belts require no dressing, but they should be kept from oil and petrol. It is not necessary to take the belt off the pulleys, but if a machine is intended to be left standing for a few days it would be a good plan to do so.

A Beginner's Preparations.

? I have just ordered a 1908 5 h.p. motor bicycle. (1.) Can you recommend a book which thoroughly explains the details of mechanism of the motor cycle? (2.) Also can you give me a list of spares that it would be wise for me to carry, and (3) is it advisable to have the tyres provided with non-skid covers at once? (4.) Where am I to apply for my license? and (5) is it necessary to have the machine with me when applying for number?—H.D., London, W.

(1. and 2.) We can thoroughly recommend the new edition of "Motor Cycles and How to Manage Them," and in it you will find a list of the

spares it is advisable to carry on a motor cycle. (3.) Non-skid covers should not be necessary in the summer time. (4.) You get your license from the County Council Offices, Spring Gardens, Trafalgar Square, S.W. (5.) When the machine is on the point of delivery apply for the numbers either personally or by letter, enclosing 5s. and stamp for reply.

Cannot Start with Spark Retarded.

? My $3\frac{1}{2}$ h.p. Brown is always somewhat difficult to start. My practice is to always run engine on stand before taking machine on the road, but neither on stand nor on the road will the engine start unless the ignition (accumulator with make and break and trembler) is fully advanced. The position of lever is such that immediately I hear the first explosion I have to retard, otherwise the engine stops through a backfire. When once started the machine runs splendidly. Upon taking plug out and laying on top of cylinder a good spark occurs in any position of the contact breaker. The engine does not misfire. Altering the timing of the inlet makes no difference to the starting. The platins on both contact breaker and trembler are in perfect adjustment. Carburetter Model H Longuemare has an 11 jet and 21 funnel. Surely a $3\frac{1}{2}$ h.p. should not require so large a jet. The petrol consumption is only approximately 60-65 miles to the gallon. Although the consumption is high and the jet large, I cannot give full extra air until the engine is running very fast. The engine does not get very hot, and the carburetter does not flood. Can you suggest a remedy?—H.H., Chiswick.

Probably the best plan would be to fit a slightly smaller choke tube, which would enable easier starting. Then overhaul the wiring and make sure none of the insulation has chafed through. All the platinum points should be perfectly clean and flat, and the contact breaker free from oil and dirt. We are inclined to think the contact breaker points are adjusted too close together. It should not be necessary to advance the spark at all when starting; in fact, it is inadvisable. As regards the consumption, you should manage ninety miles to the gallon. Check the level of the petrol in jet. It should come to within $\frac{1}{8}$ in. of the top of the jet orifice.

More Competitors in this week's End-to-end Trial.

Misfiring at High Speeds.

?

I have a $3\frac{1}{2}$ h.p. Quadrant, 1906 pattern, which misfires at top speed, and is hard to start. Lately it won't take any air except what it gets automatically. Also the platinum points pit very rapidly. I have to tap them up every 100 miles. A lot of oil gets on them. Perhaps this has something to do with the trouble.—A.H.P., Birmingham.

It looks uncommonly as if the petrol pipe or jet were partially stopped up. See that these are clear, and if you get no improvement write to us again and give us as full details as you can. Pitting of the platinum points is due to the coil being fitted with an inefficient condenser. If you fit a really good coil, which, as a matter of fact, is an expensive item, you should run your platinums for 1,000 miles without attention. Oil on the points will cause misfiring, so either fit a cover on the contact breaker or attend to the bearing which must be worn.

Caused by Wear of Fibre Ring.

?

My $3\frac{1}{2}$ h.p. machine has lately refused to climb hills at the pace it used to do; in fact, on the last run it commenced backfiring badly and refused to attain any speed at all. As I could not open the air lever as usual, I took down the carburetter and thoroughly cleaned it, and also washed the magneto contact breaker with petrol. It still ran peculiarly, and I noticed on inspection that the magneto contacts hardly separate at all. Would one of the small screws have moved, do you think, or can you suggest a probable cause of the trouble? I have ridden the machine almost 2,000 miles with no trouble at all.—F.D.H.

We have had a similar experience to yours, and the engine immediately ran as well as ever when a new fibre ring had been fitted. It is wear on this ring that has reduced the amount the magneto contacts separate, and the break at the points is not sharp enough. Filing the ring to cause a more sudden break will effect a temporary cure.

A Novice's Queries.

?

Kindly give me some advice as to my motor cycle stopping dead on hills. It is a $2\frac{3}{4}$ h.p. De Dion-engined cycle, F.N. carburetter, plain coil, make and break contact. I can get a good spark, and the compression is good. It will stand my weight (twelve stones) on the pedals. The pulleys measure $4\frac{1}{2}$ in. and $20\frac{1}{2}$ in. Is the gear too high? I do not want pace, but I should like to be able to climb all hills. I might add I bought it second-hand two months ago.—W.A.

You will be able to get better results out of your machine after more riding experience. When approaching a hill increase your speed, and as soon as the gradient causes the machine to slow down retard the spark lever gradually, and also close the air lever gradually. You may with advantage reduce the gear to $5\frac{1}{2}$ to 1. You would be well advised to have the engine overhauled and properly tuned up. It will not cost much.

A Question of Carburetter Adjustment.

?

I have lately purchased second-hand a $4\frac{1}{4}$ h.p. Phoenix Trimco with magneto, and find it hard to start. Can you tell me whether it is the carburetter, which is a Longuemare, that is the cause? I cannot throttle it down when on free engine or even on either of the two gears. Can you tell me a way to remedy, as I think it is wasting petrol, because I generally have to put in the low gear when going through towns, and then the engine races. Would it facilitate starting to have an accumulator fitted, and if so, would it cost much?—B.B., N.B.

It seems to us quite obvious that the trouble is due to the carburetter receiving too much air at slow speeds. This would account for it starting with difficulty and not running slowly. The cure is a slightly smaller choke tube. You might get some advantage through fitting an accumulator which would

Miss Blanche Roscoe, New York's pioneer lady motor cyclist.

render starting slightly easier, but the expense incurred would not make it worth while. Once the carburetter is adjusted properly, and provided the spark is in order, the engine will start without difficulty, as the starting handle is geared up. You can prevent the engine racing by using the exhaust valve lifter.

Route from London to Scarborough.

?

Kindly advise me as to the best route to Scarborough from London, and do you think three days sufficient time for this journey? I ride a $3\frac{1}{2}$ h.p. N.S.U., accumulator ignition, which is reliable in every way.—LN 9292.

The best route to Scarborough would be as follows: London, Barnet, Hatfield, Hitchin, Baldock, Biggleswade, and then straight up the Great North Road to Stilton, Stamford, Grantham, Newark, and Doncaster; here turn to the right and proceed through Thorne, Howden, Market Weighton, Great Driffield, Willoughby to Scarborough. The journey would be rather over 200 miles, and could be done in a day if you are physically fit and the machine is running well.

Irregular Sparking.

?

My 1908 $3\frac{1}{2}$ h.p. magneto Brown motor cycle misfires when running fast, but is all right up to 15-20 m.p.h., and starts easily even with a side-car attached. Carburetter is all right, petrol supply clear, and takes half the auxiliary air with throttle open. I have not touched magneto (Simms Bosch) except to look at the platinum points, which are clean. I have tried different plugs, but it has misfired since I had it. For experiment, I put a close set spark intensifier on the plug and ran machine on stand for a few minutes and the misfiring was quite obvious. Can you suggest a remedy?—L.C.C.

The spark intensifier has proved that either the magneto, wire, or plug are at fault. Have you a cover on the magneto? If so, try the engine running without it. If you have a magneto switch fitted take this off also. The high tension wire may be defective, so try another length. You had better fit a new fibre ring to the magneto, and also notice if the rocking arm which carries one of the platinum points is badly worn. If this is the case, it will also require to be replaced.

READERS' REPLIES.**Misfiring at High Speeds.**

Replying to "Novice," Burnley, page 496, I have a $3\frac{1}{2}$ h.p. Minerva which was fitted with a trembler coil, which used to misfire on the level when only slightly advanced. Everything else being in order, I tried several trembler coils, always with the same result. As a last resort I put on a plain coil, after which I never had a misfire, had far more range on the advance, and the engine was much faster. I am told that all Minervas work best with plain coils. My engine, like "Novice's," pulled well on hills with trembler coil.—JOHN L. BROWN.

Grinding-in Valves.

Re Mr. Sommerville's note under this heading, may I remind him of an old tip? Fit an a.o.v. or similar spring on stem of exhaust between head and guide when proceeding to grind in. This obviates the tedious lifting, and both hands may be used for the grinding part, as the valve will rise spontaneously on pressure being diminished. In reply to "S.H.A., N.B.," on page 490, you advise him to file ends of exhaust valves. If it is not too late may I suggest that he disconnect the valve lifter? I have an identical machine, and had the same trouble. I filed the valves, but the engine overheated and did not have much power. I then found out that the valve lifter did not fully release when I thought it did. When I adjusted the Bowden wire I found the valves much too short, and my little mistake cost me the price of two new valves, not to say anything of time and trouble. I trust "S.H.A." will read this, as well as other 1907 Rex de Luxe riders. The machine runs about 20 m.p.h. faster, and does not overheat.—W. D. HENDERSON, Dresden.

BE UP-TO-DATE

by having your machine converted into the genuine **Roc Clutch and Roc Gear** system with **live** back axle and hand starting.

The Roc conversion set includes: The combination pedal-operated clutch and speed gear under Roc patents Nos. 472/03 and 25054/06.

New back frame members with outside ball-bearings.

Metal to metal brake-work.

New 7/8 or 1in. spoked rim pulley.

Footrests and operating levers.

Starting handle.

Cost of complete conversion, £10 10 0.

Time required about 3 days from receipt of machine.

Testimonials from private users all over the Kingdom on application.

Efficiency absolutely guaranteed.

Daily demonstrations.

NOTE.—The same gear precisely is used on these conversions as on the famous Roc military models, and the same warranty applies.

The Roc system is adaptable to **ANY** make of belt driven machine.

Send for booklet and leaflet of Roc Specialities.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

South British Trading Co., Ltd.,
13-15, Wilson St., London, E.C.

Mr. H. G. BELL, author of
"The Future of Motor Cycling,"
writes:

"Dear Sir,—After exhaustive tests with your Multiple Disc Clutch and Free Engine Pulley on a 'Triumph' motor bicycle, I have nothing but praise for the device, which has converted the orthodox untractable athlete's machine into a handy and safe mount. Until one actually tries the device, its many advantages cannot be recognised. It would be hard to say under what conditions its merits are most appreciated; but if only for the facilities it gives for starting in a safe manner (viz., from a standstill), and crawling along in traffic and treacherous roads, it is a veritable boon. I found it extremely useful in the London to Edinburgh run, especially getting in and out Newcastle and Berwick.

"Yours faithfully,
"HARRY G. BELL."

IRIDIUM "Champion" Contacts, any parts fitted; returned same day; 1s. 3d. each.

IRIDIUM "Champion" Contacts, warranted pure; trimmers for polishing iridium, 9d.; no filing required.

IRIDIUM "Champion" Contacts.—Williams, 16, Wellington Street, Woolwich. Pure platinum fitted, to order, from 1s. 9d.

JEBRON Contacts, registered, 291289, vastly superior to platinum, cures misfiring; is reliability and efficiency.

JEBRON, best contact obtainable for blades, screws, cranks, rockers, plungers, magnetos, coils.

JEBRON, prices, 2s. 6d. each rivet fitted; special trimmers for polishing Jebron, 9d.; remittance with order ensures prompt attention; write for particulars and testimonials, too numerous to publish.

JEBRON Magneto Screws, complete, for Bosch magneto, DA2, will fit contact breakers, 5A, 5B, 5C, 5s. 9d. pair; old screws fitted with Jebron, 2s. 6d. each; everlasting wear, requiring no attention.

JEBRON, the King of Contacts, fitted per return post; no delay; post free home or abroad; liberal trade terms.

JEBRON—From the Inventor, J. Edwards Brown, 38, Herbert Road, Plumstead, Kent.

COUPLINGS.

ARIEL Coupler, perfect, nearly new; 27s.—Steer, 70, Deacon Road, Willesden Green.

ENGINES.

4-5 h.p. Simms Engine, M.O.V., water-cooled, quite new, and fitted high tension magneto; £11.—Farrar.

2½ h.p. Quadrant Engine Sets, cylinder, piston, connecting rod, crank cases, flywheels, exhaust valve, 37s. 6d. per set; 3 h.p. Quadrant sets, as above, 45s. set.—Farrar.

2½ h.p. King Engine, vertical, fitted contact breaker, driving pulley, good puller; £3.—Farrar.

3½ h.p. De Dion Pattern Engine, fine condition, £3 10s.; 2½ h.p. ditto, 50s.—Farrar.

3½ h.p. Standard Engine, vertical, will take trailer up most hills; £3 15s.—Farrar.

3 h.p. Quadrant, just overhauled, £3 10s.; 1½ h.p. Minerva set, engine, carburetter, tank, etc., £3 10s.—Farrar.

3 h.p. Minerva Pattern Engine, M.O.V., £3; 3 h.p. N.S.U., crank case, complete, perfect, 25s.—Farrar, Square Road, Halifax.

h.p. Twin Peugeot air-cooled engine, carburetter and coil; what offers?—28, Dock Street, Leeds.

6 h.p. Two-stroke Petrol Engine, ball governed, perfect, as new; £5.—Matthews, pawnbroker, Croydon.

FOR Sale, J.A.P., 1907, 3½ h.p., better than new, with Matchless silencer; £8.—Griffin, Filton, Bristol.

3½ h.p. Allard, with Longuemare carburetter, guaranteed.—Langham, 163, Shaftesbury Avenue, W.C.

MOTOR, Peter-Union, Longuemare, just re-bored; £6 10s.—Blunden, 40, Broomhouse Road, Fulham. After 8.

MINERVA Twin, with or without clutch and gear, as new, and faultless, seen running.—215, Coldharbour Lane, Brixton.

4 h.p. Water-cooled N.S.U. engine, including carburetter; £6 10s.—Wauchope's, 9, Shoe Lane, Fleet Street, London, E.C.

6½ h.p. Twin Stevens Engine and magneto, new, only run a few times; cost £26 13s.; what offers?—Gill, Dromore, Marton, Blackpool.

70 by 80 Engine and Carburetter, £2; 70 by 75 De Dion, 30s.; 1½ h.p. Minerva crank case, complete, 10s.—M., 10, Aristotle Road, Clapham, S.W.

FOR Sale, small gas engine, dynamo, shafting, pulleys, bracket bearings, strikers, for charging and driving small lathe; cash £6 10s.—Apply, Brock's, Motor Works, Stanmore.

ENGINES.

GENUINE 2½ h.p. De Dion Engine and coil, both as new.—Harker, Chertsey.

21 h.p. Noble Engine, 40s., or exchange for 26in. by 2in. Goodrich, or pair A Won Clinchers.—17, Mildmay Street, Lincoln.

GENUINE De Dion Air-cooled Engine, with spares, perfect, £3 15s.; Castle plain coil, perfect, 9s.—H. Langlands, Clacton-on-Sea.

23 h.p. New Fafnir Water-cooled Engine, with silencer, carburetter, coil; £6.—Roberts, 30, St. George's Square, Regent's Park, London.

TYRES.

BOOOTH.—New rubber studded cover, 26 by 2, 25s.; ditto, 26 by 2½, 27s. 6d.

BOOOTH.—Peter-Unions, 24 by 2½, 23 by 2½, 15s. 6d.; Royalty covers, 26 by 2, 12s. 6d.; 24, 13s. 6d.

BOOOTH.—Ten shillings allowed for old cover in exchange for Shamrocks, Palmers, Goodrich's.

BOOOTH.—Tyres, best make, 26 by 2, 16s.; 2½, 17s. 6d.; 2½, 21s.; 23 by 2, 16s. 6d.

BOOOTH.—Best tubes, 26 by 2, 7s.; 2½, 7s. 6d.; 2½in., 8s. 6d.; 23 by 2, 7s. 6d.

BOOOTH.—All tyres sent on approval.—Booth's Motor Exchange, Wade Street, Halifax.

26 by 5 Dunlop Inner Tube, with car valve, new; 12s.—Oliver, 154-157, Fleet Street, London.

MAUDE'S—Fully guaranteed tubes, 26 by 2in., 6s.; 2½in., 7s.; 2½in., 8s.; 23 by 2, 5s.; 2½, 7s. 6d.; 2½in., 8s.; approval willingly.

MAUDE'S—Covers, 26 by 2in., 16s.; 2½, 17s. 6d.; 23 by 2in., 17s.; 2½in., 18s.—Maude's, Powell Street, Halifax.

RICHE'S Tubes, two 26in. by 2½in., excellent condition; for sale, 8s. 6d. each.—P. James, 1, Trafalgar Square, London, W.C.

DUNLOP, 26in. by 2in. Beaded Cover, 9s.; Continental ditto, used once, 13s.; brand new 28 by 2½in., 15s.—6, Poulton Road, Southport.

PALMER Cover, brand new, no job lines, 26 by 2, £1 9s. 6d.; 26 by 2½, £1 14s.; 4s. allowed on old cover; approval.—Reynolds, Broadway, Dorset.

CLINCHERS—Special 2½in. covers, to fit 2in. or 2½in. rims, 23s. each; don't be under-tyred. It's false economy.—Farrar.

SPECIAL Line.—Clincher tubes, 26 by 2, 18s. and 23 by 2, complete with valves; 5s. 1. each, post free.—Farrar.

10s. Allowed for old covers in exchange for Goodrich, Palmers, Shamrocks.—Farrar, Square Road, Halifax.

50 Per Cent. off usual prices.—Clincher A Won brand new covers, 26 by 2, 18s. 1.; 26 by 2½, £1; 23 by 2½, heavy tricar, 15s.; 26 by 2, extra heavy, 21s.; 26 by 2½, extra heavy, 22s.; all ribbed non-skid treads.—Farrar.

TWO Clincher Tricar Covers, 650 by 65, in perfect condition, 25s. each, approval; tricar headlight, 12s. 6d. — 115, Boundary Road, St. John's Wood.

CLINCHER A Won, extra heavy, 23 by 2, and tube, new and perfect, 23s.; extra heavy A Won, 23 by 2, 12s.; A Won, 7s.; used, in good.—Outram, Laurel Grove, Southport.

ONE 810 by 85 Dunlop Tube and Cover, as new, run about 60 miles, £3 the pair, approval, deposit; also three 750 by 80 Continental heavy tubes, brand new, 16s. each.—Glendene, Station Road, Leyton, London, E.

FRESH Delivery of beaded covers, all Calmons, guaranteed and beaded: by 2½ covers, 15s.; 24 by 2½, 15s.; 26 by covers, 15s.; 26 by 2½ covers, 15s.; 23 by covers, 15s.; 23 by 2½, 15s.—Wauchope's, 9, Roe Lane, Fleet Street, London.

HALIFAX—Brand new inner tubes, best make, 26 by 2, 6s. 6d.; 26 by 2½, 7s.; 23 by 2, 7s.; 23 by 2½, 7s. 6d.; 23 by 2½, 8s. 6d.; genuine Calmon covers, fit Palmer rims, with non-slipping tread, 26 by 2½, 15s. 9d.; by 2, 15s. 9d.; 23 by 2½, 16s. 9d.; 23 by 2½, 16s. 6d.; all beaded edge.—Halifax Motor Exchange, Westgate, Halifax.

COMPRESSION**Cylinders Rebored**

and new Pistons fitted complete with Rings and Gudgeon Pin.

Compression means Power.

of Worry, Money, Trouble, and Expense,

BY USING THE

VOLTOO 2-Volt COILS

For MOTOR CYCLES and CARS.

Write to the Sole Manufacturers:

The CITY IGNITION CO.,

14, Sp. near St. Goswell Rd., London, E.C., or 'Phone 7822 Central,

FOR ALL PARTICULARS.

TRADE PRICES.

Any make of MOTOR CYCLE or CAR OVERHAULED. COMPRESSION RESTORED, NEW CYLINDERS, PISTONS, RINGS, BUSHES, etc., FITTED. NEW PISTON COMPLETE & RE-BORE CYLINDER 14/- up to 2½ h.p. Larger sizes in proportion. Gear Wheels and Cams made and Cut. Prices given by return of post.

We are the ACTUAL MANUFACTURERS. 4½ h.p. Noble for sale, Winner Essex Hill Climb, price £27. 10. 0.

NOBLE & CO., 9, SURREY ROW, BLACKFRIARS ROAD, S.E.

REPAIRERS.

MAGNETOS Repaired and re-magnetised, coils tested.—New Century Co., Grey Street, Holborn.

£5 any motor cycle we cannot repair.—Whites, 22, Brook's Alley, Church Street, Liverpool.

GRIFFIN and Sleat, Eastbourne.—Cylinders re-bored, and new pistons fitted, or engine completely overhauled; let us quote you.

CRACKED Water Jackets of motors successfully repaired by Lea's metallurgical process.—Lea and Son, engineers, Runcorn.

COMPRESSION.—Cylinders rebored, fitted with pistons, rings, gudgeon pins.—Liverpool Engineering and Motor Co., 12, Hart Street, Liverpool.

SEND us the motor cycle or car that won't go; moderate prices; best work, by engine expert; engines and parts bought.—Maurice Liming, engineer, Crookham, Fleet.

LEICESTER and County Riders should look up the Central Motor Co., Langton Street, Belgrave Gate, Leicester, for repairs, tyres, accessories, and accumulator charging.

CCCCCCCCC Compression means power.—Cylinders re-bored and new pistons fitted; guaranteed fit 4-1,000in.; bears 13 stone on pedal; write for list.—Gradior Machine Co., Compression Specialists, Stafford.

TO West of England Motorists.—Car and motor cycle repairs, prompt and reliable; cylinders re-bored, new pistons and rings fitted; don't hesitate; send straight to us.—Hamlin, Motor Works, Bridgwater.

REPAIRS and Overhauling.—We have the finest repair works in London for motor cycles, with up-to-date machinery; estimates free; new cylinders for any make of engine, pulleys, valves, gears, and all replacements; send for our new booklets, with prices.—Laystall Motor Engineering Works, 27 and 29, Laystall Street, Rosebery Avenue, E.C.

EXCHANGE.

EXCHANGE, Steam Car for motor cycle (twin).—25, High Street, Ryde, I.W.

RALEIGHETTE Tricar; £36, or exchange for good twin, or 4½ h.p. F.N.—315, Hessel Road, Hull.

EXCHANGE Trailer for handle-bar watch, or speedometer; sell 50s.—Baker, 59, Reads Road, Blackpool.

IMPERIAL Rover Push Cycle; cost £12, take £6, or exchange for 1½ h.p. motor cycle.—151, Knight's Hill, West Norwood.

WANTED, motor cycle; exchange chest tools, gas engine, and great variety.—Prance, St. Budeaux, Devonport.

10-12 h.p. Argyll Tonneau, lamps, wind screen, for two-seater and cash.—Thompson, Victoria Terrace, Durham.

WANTED, your present mount in part payment of any 1908 make, keen quotations.—Farrar, Square Road, Halifax.

GENT'S Three-speed, perfectly new, £10 10s., green enamel, cycle and small cash in exchange for good motor cycle.—Millard, Dinnington, Rotherham.

MOTOSACOCES, 1908 models; second-hand motor cycles, foreign and British stamps taken in part exchange.—Motors, 41, Green Street, Cambridge.

EXCHANGE 3½ h.p. Centaur, chain drive, two accumulators, long bars, Palmers, M.O.V., for belt drive, or sell £15.—Humphreys, 3, Ridgeley Road, Harlesden.

EXCHANGE 6 h.p. Starling Two-seater Car, brand new few months ago, lamps, tools, spares, for good motor cycle and cash adjustment, or sell £95.—King, Alfreton.

EXCHANGE, Vindec Special, two-speed gear and free engine, and new Millford castor sidecar, for small two-seater car, about 1 h.p.—49, Hurst Road, Eastbourne.

EXCHANGE, summer suit, unsoiled, 5ft. 10in., for 26 by 2½ Clincher, or similar heavy cover and butted tube; approval both sides.—292, The Motor Cycle Offices, Coventry.

SINGLE-SEATED Car, Aster engine, Bozier gears (light), for Minerva twin, Alldays Traveller, or 4½ h.p. De Dion car, or exchange offers.—Needham, Shalesmoor, Sheffield.

In answering any of these advertisements it is desirable that you mention "The Motor Cycle."

Can Motor Bicycles Climb Hills?

By "IXION."

AT the recent Sutton Bank hill-climb some magnificent performances were accomplished by various crack riders, mounted on machines that to all appearance were standard models, as sold to the public. Mingling with the crowd of experienced competition riders were a number of very irate and dissatisfied private owners of apparently similar machines, many of whom had entirely failed to ride up even to the top of the Trough. In fact, one individual approached the rider of a well-known firm mounted on a sister machine, and angrily said he would give him his own mount for nothing if he could induce it to climb the terrible Bank within an hour at any speed, however low. Such facts as these are repeated in motor cycling circles throughout the country, and lead the uninstructed to imagine that the only thing in common between the two nominally identical machines, one of which the trade rider sells to you and the other of which he rides himself, consists of the engine dimensions—that yours is a roughly finished model, hastily rushed through the works with the minimum of attention; and that his is perhaps made of better material, and is certainly a far better finished machine.

There is only the barest modicum of truth in these notions, and I desire, therefore, to state a few facts, which will perhaps reconcile the amateur to the fact that there are perhaps a dozen hills or so in the country which his machine will not climb. We will picture Mr. Jones, the crack rider of the ——— Manufacturing Co., and two machines, ticketed A and B. Machine A is his own travel-stained mount, machine B is the

spick and span new machine due for delivery to you, dear reader, next week-end.

1. Under the practice of nearly every firm (there are one or two less honourable exceptions), machines A and B are absolutely identical when they leave the works—same specification, same material, same workmanship, same efficiency.

2. Machine A is entered for a hill-climb. Mr. Jones alters all its adjustments—carburation, compression, etc.—till it will ascend the fearful hill in question at forty miles an hour.

3. Machine A is entered for an A.C.U. 1,000 miles. Mr. Jones prepares his machine for the trial. He goes through without losing a mark. But if the trial included that aforesaid famous hill, he would fail to ascend it all; the adjustments which spell a furious ascent of a colossal hill are not calculated to ensure a 1,000 miles non-stop with a cool engine, and no trouble. Moreover, if they were so calculated, it would be impossible for that delicacy of veneer to be maintained without constant attention.

4. We will now imagine that Mr. Jones has piled up machine A against an unlighted waggon on a dark night. Two important trials are looming in the near future. The ——— Co. accordingly keep you waiting a week or two longer for delivery, transferring a third machine C to your name on their books, and handing over machine B to Mr. Jones for his own riding.

5. The first event is a speed trial up Sutton. Thanks to Mr. Jones's skilled tuning, machine B ascends Sutton at a speed $\frac{1}{5}$ s. faster than machine A originally did.

Can Motor Bicycles Climb Hills?

6. The second event is an A.C.U. 1,000 miles. Machine B goes through non-stop in the clever hands of Mr. Jones, but it fails on one or two hills less formidable than Sutton, and for two reasons:

(a) It is not tuned for climbing exceptional hills.

(b) It has lost a shade of "tune" in the preceding 700 or so miles it has run.

7. Most probably, dear reader, if Mr. Jones handed over either machine A or machine B in the same tune as it had when he climbed Sutton on it, you would not be able to get it up Sutton; and this for two reasons:

(a) You do not possess the same delicacy of driving skill as Mr. Jones has.

(b) You have not the pluck to take sharp corners and fearful surfaces at the necessary speed.

We now arrive at certain conclusions:

1. There are about a dozen hills in England which standard machines will not climb unless—(a) tuned in a way that spoils them for touring; (b) tuned to a pitch which cannot be maintained in touring; or (c) geared ridiculously low; or (d) driven at a speed which is risky.

2. On the other hand, these machines will—

(a) Undoubtedly climb any hill in the country bar a dozen notable exceptions.

(b) By careful selection of route avoid these hills.

And if you, my dear sir, obstinately demand the ability to climb these said dozen hills, you have a very simple alternative. You must fit one of the several excellent two-speed gears now marketed, by the aid of which you can climb Sutton, and, what is more, (a) climb it at a slow and comfortable pace; (b) climb it every time; (c) climb it twenty times running; (d) climb it without any special preparation; (e) climb it when your engine is far below par; (f) climb it when your engine is heated by a previous 100 miles non-stop; (g) climb it when it is blocked by traffic; (h) climb it when it is liberally smeared with grease; (i) climb it when you are an absolute novice; (j) climb it though you are an unspeakable duffer.

On the other hand, supposing you were to assault our friend Mr. Jones at the foot of Sutton on a race day, and by main force deprive him of machine A, and compel him to exchange it for machine B, even with the aid of machine A you would—

1. Fail once in three times from sheer funk.
2. Fail once in three times from driving errors.
3. Fail altogether a month hence.
4. Fail to get home without several road stops.
5. Wish you had kept your more comfortable machine.

SAROLEA ENGINES FOR 1908.

THE sole agents for these engines in Great Britain are the Tormo Manufacturing Co., H. and D. Friedenhai, 67, Bunhill Row, E.C. These engines are better known to our readers as the Kerry, being fitted exclusively to Kerry

motor bicycles. They have been on the market since 1903, and their consistent running and the excellent workmanship apparent in their construction have rendered them deservedly popular.

One of the chief points about the engine is the splendid casting of the radiating fins, which are about as thin and clean as can be found anywhere. No less than four different types of engines are constructed,

and we will deal with each separately.

The 2 h.p. has an automatically operated valve and a bore and stroke of 66 by 72 mm. The engine weighs about 29 lbs. An additional bracket can be supplied for carrying a magneto, which is then driven off the half-time shaft by a chain. This engine is highly suitable for lightweight motor bicycles.

The next model which we have to consider, the 3 h.p., is made in two types—one type with automatic valve and the other with mechanical. When a mag-

neto is fitted to this engine, a neat form of enclosed gear drive is supplied for the purpose, together with an additional bracket for carrying the magneto. The 3 h.p. engine has a bore and stroke of 76 by 85 mm.

We now come to the twin-cylinder engine, and here again we have three distinct types of engines—4 h.p., 5 h.p., and 6 h.p. The first-named has a bore and stroke of 66 by 72 mm., the second 70 by 80 mm., and the last-named 76 by 80 mm., which is highly suitable for passenger work. Provision is made for fitting a magneto, the drive being transmitted by means of enclosed gear wheels.

The 6 and 8 h.p. Sarolea engines can also be obtained water-cooled for tricars. The type of carburetter usually fitted to these engines is the Model E Longuemare, and these carburetters and their parts and accessories may be obtained from the company.

The two types of Sarolea engines illustrated here are the 6 h.p. water-cooled and the single-cylinder 3 h.p., with mechanically operated valves and magneto ignition. It will be seen that the cover has been removed from the timing gear case, showing the well-arranged valve-operating mechanism and the magneto drive. An idea can also be

A Sarolea twin-cylinder water-cooled V type engine with automatic inlet valves.

1 h.p. Sarolea engine with m.o.i.v. showing the magneto transmission.

formed of the excellence of the cylinder casting.

CURRENT CHAT

Special Features

THE A.C.U. END-TO-END RELIABILITY TRIALS.

Fully Illustrated Description.

Where are the Scouts?

We cannot congratulate the A.A. on its scouting arrangements on the Maidstone and Sevenoaks Road. At present the police are very busy on the Sevenoaks Road, and no sign of a scout is to be seen, whereas on the eighteen miles stretch from Ashford to Folkestone no less than four of the A.A. men were seen on a recent week-end.

527 Miles in One Week-end.

One of the best rides on a motor bicycle we have heard of lately is one by W. T. Walton, of West Hartlepool, who rode 527 miles in 26h. 27m. during the week-end before last. He left West Hartlepool at 1 p.m. Saturday in order to compete in the Leeds M.C.C. twenty-three hours' London and back ride, arrived at Leeds (75 miles) 6 p.m., left Leeds 8.33 p.m., arrived London (188½ miles) 7 a.m. Sunday, arrived at Leeds 7.12 p.m. Sunday, arrived at West Hartlepool 11 p.m. Sunday. The total time occupied on the long journey was thirty-four hours, but after deducting control times the total riding time was 26h. 27m.

Track Racing at Berlin.

The meeting organised by the Berlin members of the German Motor Cyclists' Association at Steglitz was a great success, but the tremendous heat—95° Fahr. in the shade—wrought such havoc with the pneumatics that the managers decided to replace the hour race by one over thirty kilometres. The four events resulted as under:

Ten kilometres (open to touring machines up to 4 h.p. and any branch member having participated in three official branch tours this year).—(1) A. Knoechel (3½ h.p. Phänomen), 7m. 12s.; (2) Oskar Schubert (2 h.p. Magnet); (3) Z. von Grabla (3½ h.p. Phänomen).

Ten kilometres (open to light touring machines up to 2 h.p., and all members of association).—(1) A. Colombo (Motosacoche), 9m. 42½s.; (2) B. Gregory (Motosacoche); (3) Oskar Schubert (2 h.p. Magnet).

Twenty kilometres record race for racing and touring machines of any h.p. and all members of the association.—(1) G. Retienne (5.4 h.p. Progress), 12m. 26s.; (2) M. Dietz (4 h.p. Magnet); (3) A. Knoechel (3½ h.p. Phänomen); (4) O. Schubert (3½ h.p. Magnet).

Thirty kilometres race for machines of any h.p. and all members of the association. The large number of entries for this event necessitated two preliminary heats and a final, the latter resulting thus: (1) G. Retienne (5.4 h.p. Progress), 18m. 11½s.; (2) Fr. Kuehn (5½ h.p. Magnet); (3) A. Knoechel (3½ h.p. Phänomen); (4) O. Schubert (3½ h.p. Magnet); (5) W. Ebstein (3½ h.p. Brennabor).

Police Traps.

On the Birmingham-Evesham Road, north and south of Alcester.

Between the White Hart and Hook Church, on the Leatherhead Road, Surrey.

At Bromley, Kent. The operations extend from the Swan publichouse (at the top of Swan Hill) to the station garage at Mason's Hill. Drivers who exceed 15 m.p.h. are stopped.

By Motor Cycle from India.

Lieut. Edward Noel, who, it will be remembered, was to attempt to ride a motor bicycle overland from India, writes that he had perforce to give up the idea, as he was unable to make headway. He says: "I landed with my motor cycle at Jaffa, and started towards Jerusalem, although the road has never been repaired since the railway was opened some twelve years ago. Nevertheless, I was able to make fair progress. The constant bumping and scraping as the crankcase hit the ground was rather disconcerting at

first, and frequent dismounts had to be made for soft patches of sand. But when I got to the hill country I found that without a two-speed gear progress was impossible. The machine itself, with spares and petrol, weighed 265 lbs. After pushing and riding alternately I arrived within a few miles of Jerusalem, when I was too exhausted to continue, as six or seven hundred miles of hilly country lay before me. I realised that I could never hope to get over it in the time available, so reluctantly returned to Jaffa. I afterwards walked partly over the route I intended to ride; perhaps it was lucky I did not persevere, as I was robbed twice by Bedouin Arabs. I may be accused of foolishness in attempting this ride without a speed gear, but it must be remembered that I had intended originally to have started from Baghdad, and by this route I would have avoided the hills to a great extent, and would not have been encumbered with so much weight, as I had forwarded supplies of petrol."

A.C.U. competitors afloat off St. Michael's Mount, Sunday, July 12th. A little water trip before the more important land journey.

The Automobile Association.

Striking evidence of the ever-increasing popularity of the A.A. is afforded by the fact that at the last meeting of the executive committee no fewer than 452 new members were elected.

Police Timing Pedal Cyclists.

The police are timing pedal cycles as well as motor cycles and cars on the London Road, Bromley. A batch of pedal cyclists has already been fined, and on Sunday several more were stopped in addition to motorists.

Essex Motor Club.

This club's third annual race meeting is booked to take place at the Stadium, Shepherd's Bush, on Saturday, August 8th, and bids fair to be even a greater success than the two last meetings, at both of which records were broken. The splendid DuCros Cup for the hour race, in which Messrs. Colver and Collier both have a share, will again be competed for, and should provide a most interesting tussle. Attempts on record will also take place. A tourist event will be included in the programme, and with the large number of enthusiastic road riders a big entry is looked for. The trials hon. secretary, Mr. Ernest Bass, Ongar, Essex, has the arrangements in hand, and entry forms are now ready.

The M.C.C. Team Competition.

We are pleased to announce that the donors of *The Motor Cycle Challenge Cup* have signified their intention of presenting (subject to acceptance) to the Motor Cycling Club another trophy of similar value to the one which has been won by the Coventry M.C. Further details will be announced shortly.

Champion Lawn Tennis Player a Motor Cyclist.

Lawn tennis players will be interested to note that Mr. A. F. Wilding, the champion lawn tennis player, was a competitor in the End-to-end Trials last week, riding his 6 h.p. Bat-Jap twin-cylinder. A photograph of Mr. Wilding with his machine is published on page 574 of this issue.

Harrogate Meeting of the Motor Union.

The eleventh provincial meeting of the Motor Union will take place on Saturday, July 25th, at Harrogate, by invitation of the Yorkshire A.C. and the Harrogate and District A.C.

Motor Cycling in South Australia.

For the second time the first place in motor cycling events of the annual sports meeting at the Adelaide (South Australia) Oval has been won by the rider of a N.S.U. motor bicycle.

Coventry M.C. Open Motor Cycle Hill-climb.

The above event will be decided on August 15th at Newnham Hill, near Daventry. There will be six classes, including variable geared and passenger

Won on a "Mattress."

A correspondent informs us that a prominent Birmingham daily paper, in describing some races at Villa Park, Aston, states that Mr. H. C. Colver won the light-weight mile race on a "Mattress" in 1m. 19s., and our correspondent suggests that this reflects great praise on Mr. Colver. Most of our readers will doubtless guess that Matchless was the word intended. Winning a motor cycle race is a little more strenuous than lying on a mattress, as many riders can testify.

A Severe Punishment.

Mr. Reginald G. Mundy, a young Croydon motor cyclist, and one of the competitors in the London to Edinburgh twenty-four hours' run on June 6th, had the misfortune to come under the notice of the Durham County Police while riding through the village of Chester-le-Street, which lies between Sunderland and Durham. In consequence he has had his present license, which would have expired in February next, suspended, while the Bench has also forbidden him to hold another license for a year after that date. This seems a severe punishment, seeing that the estimate the police gave of his speed was not more than twenty-five miles an hour. It is true a crowd was said to be in the street at the time, but if that be so, something unusual must have been taking place, for crowds are not common in the village. We are no champions of reckless driving, but motor cyclists know well enough how easy it is, especially for the police, to make mistakes as to speed.

FUTURE EVENTS.

- July 25—Motor Cycle Races on Portmarnock Beach promoted by the Dublin and District M.C.C. and M.C.U.I.
- Aug. 3-4—Motor Cycling Club Run to Land's End and back for Charles Jarrott Cup.
- " 7—A.C.U. 24 Hours' Ride, London to Plymouth and back.
- " 8—Essex M.C. Open Race Meeting at the Stadium.
- " 15—Coventry M.C. Open Hill Climb for Motor Bicycles and Passenger Motor Cycles at Newnham Hill, Daventry.
- " 22—A.C.U. Annual Race Meeting at the new Stadium, Shepherd's Bush.
- " 29—Essex M.C. Open 200 Miles Non-stop Run for Motor Cycles.
- Sep. 12—Motor Cycling Club Petrol Consumption Tests.
- " 23—The International Auto Cycle Tourist Trophy Race in the Isle of Man.
- " —Penalty Run for Members of the A.C.U. and Clubs in the South of England Districts affiliated to it.
- Oct. 3—A.C.U. Council Meeting at Warwick.
- Nov. 20-28—Thirty-second Annual Stanley Show.

machines. Special prizes will be given for best performances by private owners on formula and on time. Particulars and entry forms are ready, and can be obtained from the Trials hon. secretary, W. Grew, 19, Hertford Street, Coventry. The event being open all competitors must obtain the A.C.U. racing license from the secretary, F. Straight, 18, Down Street, Piccadilly, W.

90 mm. x 54 mm.

G. Gerhard, of the S.E.A.A., a motor cycle prize winner at the opening race meeting at the Stadium, is having an entirely novel engine built by the Advance Co. for the Essex Motor Club's meeting on Aug. 8th. It is a single cylinder automatic inlet, 90 mm. bore with an exceptionally short stroke, viz., 54 mm. It is being built purely as an experiment.

Competitors who took part in the A.C.U. End-to-end trial last week. 1, H. R. Dougal (5 h.p. Vindee). 2, C. A. Palmer (4 h.p. Roc two-speed). 3, F. W. Applebee (5 h.p. Rex).†

Questions & Replies.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, must be accompanied with a stamped addressed envelope for reply.

Wiring Up a Coil.

? I am fitting up a motor cycle. The coil is a Fuller Midget non-trembler, marked +, c, e, and s.p. Engine is a $2\frac{3}{4}$ h.p. genuine De Dion with two terminals on contact breaker. Kindly advise me how to wire it?—F.S., Manchester.

The following is the meaning of the letters on your coil: c, contact breaker; e, earth; s.p., sparking plug; + to positive terminal of coil. The wire to contact breaker should connect on screw terminal. The other terminal should be connected to frame.

Gear for Sidecar Work.

? I have a 1907 $4\frac{1}{2}$ h.p. twin Minerva, to which lately I have had fitted a sidecar. It is good for the flat and undulations, but will not take ordinary hills. It is fitted with $4\frac{1}{2}$ in. engine pulley, 19 in. rim pulley, 26 in. wheels, making a gear of about $4\frac{1}{4}$ to 1. Shall I get the requisite power by changing my engine pulley for one 4 in., and if I did, would the engine be likely to overheat?—W.G.N.

You had better reduce the gear to about 5 to 1, and the machine will go better. Of course, the only real solution is the fitting of a good two-speed gear. We do not think you will be troubled with overheating if you oil frequently.

Pulleys out of Alignment.

? When I wheel or ride my motor cycle ($3\frac{1}{2}$ h.p. Minerva) the $\frac{7}{8}$ in. Whittle belt persists in rolling over and running off.

It generally does this commencing from the bottom of the back belt rim pulley. It acts just the same with a $\frac{7}{8}$ in. Dermatine. I've ridden many miles with both belts before they began to act so. It runs all right with a $\frac{3}{4}$ in. Dermatine. Should I do any good (or harm) if I bent out the edges of the belt rim? The wheels and pulleys seem to be in perfect alignment, but the bottom edge of the rim seems to cut the outside edge of the belt as it comes round to the bottom, and then twists and throws it off.—FLABBERGASTED.

The pulleys are evidently not intended for a $\frac{7}{8}$ in. belt. Nothing else would make the belt come off in this manner if it fits the pulleys properly. You can do it no harm by bending the edges of the belt rim provided you preserve the correct angle of 28° .

Spares for a Magneto.

? (1.) What is likely to go wrong with a magneto on the road? (2.) What spares is it advisable to carry for magneto when on tour? (3.) What effect will dust have on magneto if left uncovered? (4.) My twin Rex de Luxe occasionally travels thirty or forty yards with muffled explosions and no power, and then suddenly jumps forward with full power and loud normal explosions. I may say this generally occurs when machine has not much way on. Can you explain this?—A.H.S.

The N.S.U. Cup, presented by the N.S.U. Motor Co. to the Newcastle and District M.C.C., for its Reliability Trials on August 3-4.

(1.) For the first month or two nothing at all, provided you keep the contact breaker, the brass cover and spring, quite clean. All that goes wrong is wearing of the fibre ring and rocking arm and spares should be carried. (2.) One spare platinum point should be enough, as these parts rarely give any trouble. On a very long tour carry a spare contact breaker complete. (3.)

The presence of dust, of course, increases wear, and may cause short circuiting. (4.) The trouble may be due to a temporary stoppage in the carburetter.

Accumulator and Magneto Plugs.

? (1.) Why are ordinary sparking plugs not equally suitable for accumulator or magneto? (2.) Please mention any makes which are? (3.) Are magneto plugs equally good for accumulators?—E.S.

(1.) Some points are more easily fused by the fierce spark produced by a magneto. Sparking plugs for magnetos are usually better made than those for accumulators. (2 and 3.) L.M., Oleo, and many other plugs are suitable for both ignitions.

The Amount of Oil for an Engine.

? Don't you think a pumpful of oil every five miles is too much to give a 6 h.p. twin-cylinder tricar engine? I find a good deal of oil comes out at the pulley spindle, and a little of it gets on to my rubber belt if I give engine a pumpful every five miles.—W.N.C.

Yes, it seems as if you are lubricating too frequently. No hard and fast rule can be made, as naturally it depends on the size of the pump, the amount of low gear work the engine is doing, the quality of the oil, and various other factors. If your engine smokes at all, reduce the amount to a pumpful for ten miles or half a pumpful for five miles. If oil leaks out of the bearings and joints try a thicker oil.

Strain caused by Sidecars.

? I ride a 5 h.p. two-speed machine with rigid sidecar (fixed wheel), and have had two front spindles ($\frac{3}{4}$ in.) broken in 500 miles. Have written the makers, who say that with some sidecars there is undue strain on front wheel when turning corners. Have noticed this strain at corners, but have not heard of anyone having spindles break. At first attempt I steered the machine without any difficulty, so think the car properly attached. Sidecar is $\frac{3}{4}$ in. wider than usual.—J.A., Glasgow.

The only thing to do is to get a specially strong hub and spindle, and have the whole wheel re-built. Evidently the existing spindles are not strong enough for the work.

Adjusting Magneto Driving Chain.

? The chain which connects my magneto to the camshaft has stretched and slips off when I pedal vigorously to start machine, or when engine starts firing. It is a $3\frac{1}{2}$ h.p. Peugeot, and I have taken magneto on. I find when I turn armature with hand it offers resistance in one place, and after passing that spot it seems to spring round. Should this be so, because I have not taken it off before? —Dr. F. E.

You will have to adjust the chain. This can be done by loosening the bolts underneath the magneto and slipping it forward slightly. Do not have the chain too tight. The resistance referred to is quite in order. It is caused by the "pull" of the magnets.

Grinding In New Valves.

? (1.) I want to know if new exhaust valves should be ground in, as, after fitting a new Druid exhaust valve, I have lost nearly all compression. What is the simplest method of grinding in a valve, and when shall I know it is sufficiently ground in? (2.) The compression escapes past the valve cap. I can feel it escaping with my hand. (3.) Ought both valves and tappets to have exactly same clearance?—J.S., Ayr.

(1.) New valves should always be ground on to their seatings until the compression will stand the rider's weight on the pedals for half a minute. The best thing you can do is to purchase a copy of "Motor Cycles and How to Manage Them," which gives you full instructions regarding valve grinding. (2.) Thoroughly clean the joint and fit a good washer. If this does not cure the leak paint it over with fish glue. (3.) Both valves and tappet should have the same clearance, i.e., slightly less than 1-32nd of an inch.

Oil Escaping from Cylinder.

? My engine is a 2 h.p. Minerva, 1903 pattern inclined, and I am continually troubled with oil spraying out of the release valve, which, as you will probably remember, is situated just above the 2 to 1 gear cover. It is very troublesome, as the oil collects on the contact breaker case and runs into it, and also all over the side of the engine (to say nothing of covering my boots and trousers). At the beginning of this year I fitted new piston rings, and the trouble first commenced after they had been in for about fifty miles. If you can suggest a means of curing or preventing it I shall be most grateful, as in all other respects the engine gives me extreme satisfaction, and is far and away the most reliable I have ever had.—FO 77.

Fit a small copper pipe on to the orifice of the relief valve, and lead it away from the engine so that it passes what oil there is on to the ground. It will make a wonderful difference to the cleanliness of the machine. Probably thicker oil would stay in the engine better.

One Cylinder Firing in the Silencer

? Could you explain the following difficulty which I have with my twin-cylinder Minerva with Eisemann magneto? The front cylinder runs perfectly, but the back one very often fires in the silencer. Result, useless on hills. Compression in back cylinder is perfect, spark is beautiful, and occurs even at very low speeds indeed. Perhaps some of your readers may have had similar symptoms.—I.M.D.

A twin-cylinder Eisemann magneto is so set that the maximum positions obtained by the armature occur at different intervals in the two cylinders, so that it is just possible that the lines of force are cut so far away from the maximum position in the case of the back cylinder that the spark is inefficient, or perhaps non-existent when the magneto is fully advanced. The only thing that can be done is to advance or retard the position of the driving pinion or the sprocket on the armature spindle in relation to the existing position of the armature.

Explosion Every Other Cycle.

? My $2\frac{3}{4}$ h.p. motor cycle only fires every other time, and as regular as if it was made to do so. I have ground in valves, had carburetter down, put on an earth wire and every other thing I could think of. Do you think that it might be the high tension part of the coil, seeing the trembler seems to work all right? But again, when I have the plug out and place it on the frame it sparks quite well then. Would the inlet valve have anything to do with it? I might say it is a De Dion engine and carburetter, Nilmelior coil and wipe contact.—T.A.F.

Have you tried fitting a new sparking plug? Perhaps the insulation of the latter is defective. An explosion every other cycle is generally due to imperfect mixture, either too weak or too rich in petrol. It is just possible that the high tension wiring of the coil may be giving trouble, so if a new sparking plug does not cure the difficulty it would be as well to have the coil tested by an expert electrician.

Break of Magneto Points. Piston Rings.

? (1.) Is it of any consequence how much lift there is on make and break of magneto fitted to the 1906 Triumph? The platinum points seem to be separated by about one quarter of an inch when current is broken. I cannot see that it makes any difference how much the platinum points part, so long as the current is broken. I may say that magneto is working properly, but I have had some trouble with pitted platinum points. (2.) Would a set of piston rings with stepped ends instead of slotted ends be satisfactory? Are stepped rings liable to break at shoulder?—H.B.

(1.) It does not matter within reason how much break there is, but the Bosch Co. recommend that the points separate .5 mm. The fact that the platinum points get pitted is due to your not keeping the condenser connections clean. These are—the centre of the

brass cover and the point of the spring which keeps it in position, also the other connection at the top of the spring. (2.) Stepped rings are not likely to break at the shoulder, and if of the proper material are quite satisfactory.

Alterations for a Passenger Attachment.

? I have recently purchased a 5 h.p. Vindec Special, and am intending to attach a sidecar. The passenger I shall mostly take weighs eight and a half stones, and my own weight is just under ten stones. The machine is fitted with adjustable pulley giving a highest gear of $3\frac{3}{4}$ to 1, and lowest gear of $5\frac{1}{2}$ to 1. Do you think that, for riding about Hertfordshire, Beds and Bucks, I had better first try an intermediate gear of $4\frac{1}{2}$ to 1, or would you start straightaway with the lowest available gear, viz., $5\frac{1}{2}$ to 1? May I expect to surmount all ordinary hills on the low gear with the sidecar and eighteen stones with 5 h.p. and lin. rubber belt? I have a two-speed gear in view, but would prefer to wait a bit, having only quite recently purchased the machine itself, and still having the sidecar to buy?—C.S.L.

You will be able to get about quite well with a $4\frac{3}{4}$ or 5 to 1 fixed gear, but even $5\frac{1}{2}$ to 1 will not be low enough for the steepest hills; a two-speed gear would be much better.

Weak on Hills.

? My $3\frac{1}{2}$ h.p. 82 by 90 mm. engine seems to have no real life in it compared with a friend's machine of similar power. It starts quite easily after flooding the carburetter, and runs best at about twenty miles an hour with the throttle just open and the air lever almost fully open. On reaching a steep hill I open the throttle, but the engine soon dies away if the hill is steep and long. From what I have read, I fancy I cannot give the engine sufficient air. Should I increase the air supply or reduce the size of the jet? Do you think alterations to the carburetter will make the machine a good hill-climber and more speedy, or does it mean grinding in the valves, altering the timing, etc.?—NOVICE.

An improvement would be made by increasing the air supply. Whether you fit a smaller jet or a larger air funnel depends on the consumption of the engine. If it is not too high, change the air adapter, but if the consumption is excessive try a smaller spray. The alteration would no doubt effect a considerable improvement, as your engine does not appear to get sufficient air. The compression is all important in the case of hill-climbing, but if the valves and timing have not been altered there should be no need to interfere with this part of the engine.

Will W. H. Pedler send his address to the Editor, as his original letter has unfortunately been mislaid?

Readers continue to send us queries without enclosing stamped addressed envelopes in accordance with our rule. Such queries will not receive attention.

FIRST DAY, Monday, July 13th.—Land's End to Taunton, 152½ Miles.

THE competitors were early astir on Monday, the 13th inst., and the old quayside at Penzance resounded with the reverberations of motor cycle engines being warmed up on their stands. The day was beautifully fine, but over to the westward some heavy threatening rain clouds were to be seen; this, together with the fact that the barometer had been falling steadily since Sunday morning, foretold that some rain might be expected before the day was over. The tortuous and hilly road to Land's End was in quite good condition, though a trifle greasy in places under the trees. Many of the bad corners have been greatly improved to facilitate the G.W.R. motor bus service, and certain sections of the road have been widened. Almost continuously from 6.30 to 7.30 a.m. the competitors streamed in to the starting point, and by the time all had arrived the space in front of the Land's End Hotel presented an animated scene. In addition to the competing machines, there were many motor

The Start.

Punctually at 8 a.m. the first batch of riders were sent off as far as possible in numerical order. All got away in excellent style, especially those whose machines were fitted with change-speed gears, and in twenty minutes all had departed on this the first stage of their journey to the most distant point of Great Britain. Hardly had the Napier on which we travelled reached Sennen when down came the rain in all its fury, drenching all the occupants before the hood could be erected, and thereby causing no little inconvenience and no small amount of delay. Near Penzance the rain ceased, and there appeared to be every indication that no great amount had fallen, so that nearly all the competitors were fortunate enough to escape it. Having wasted much time, we had a good deal to make up, and so nothing was seen of the competitors till we reached the neighbourhood of Truro. For some unknown reason the men were sent through Truro this year instead of going by Zelah and Mitchell, which is the more direct route, and the one depicted

Group of A.C.U. Trials competitors photographed outside the Land's End Hotel previous to departure for John-o'-Groat's House, N.B.

cycles and cars which had borne spectators to the starting point, to say nothing of the three official cars which were to follow the competitors on their long journey to the North. These were a 40 h.p. six-cylinder Napier, which Mr. G. H. Levick (who took part in the End-to-end run two years ago as a competitor) brought to assist the officials; a 20 h.p. Rover driven by Mr. J. K. Starley, bearing Mr. Straight, the A.C.U. secretary, and Mr. A. G. Reynolds, one of the judges; and a 14 h.p. N.A.G. carrying other officials.

on the preliminary programme. Near the Cornish capital (where, by the way, the roads were very wet and greasy) W. Ridler (6 h.p. Leader) was seen to be in trouble, due, it afterwards transpired, to over-lubrication. A little farther on, Dr. Mayo (5 h.p. two-speed Vindec) was found inflating his tyres. His troubles in this direction began early, as immediately before the start he drew two nails from his back tyre. From Truro onwards the roads were fair at times, and then treacherously greasy. W. H. Wells (5 h.p.

Auto Cycle Union End-to-end Reliability Trials.—

Vindec), who rode well ahead of the others, came in for a great deal of rain, while those behind him got little or none. Out of Bodmin there is a long and very stiff hill, the surface of which was in a terribly greasy condition, causing several of the men to dismount. Then followed a remarkably fine piece of country over Bodmin Moor, where the road surface was dry and good. The hills, however, were severe, as was the case throughout the day's journey. It was in this locality that we found Nelson (5 h.p. Rex) in trouble with ignition.

Lunch at Launceston.

We were now well up with the competitors, and reached the White Hart Hotel, Launceston, in good time, where an excellent lunch was served. Most of the men reported having had an excellent run. After lunch the whole of the route continued to be very hilly, while between Okehampton and Exeter the surface was perfectly appalling, and, in addition, was abominably greasy, rendering this portion of the journey excessively fatiguing. On the whole, the machines appeared to be behaving much better on the hills than was the case two years ago, thus showing that the A.C.U. trials are having a good effect upon design and construction. Though this is the second time the End-to-end trial has been run, the interest shown by the inhabitants in the towns and villages through which we passed seems to have in no way abated. Among those seen in trouble after lunch were Miss Hind (5 h.p. Rex), who was dismounting the inlet pipe from her engine. She also had trouble later with the spokes of the rear hub.

Arrival at Taunton.

Most of the men arrived at Taunton in good time, and, despite the severity of the day's journey, the bad roads, and inclement weather, the amount of trouble experienced was small. Dr. Mayo, Gwynne, and one or two others had spills, but suffered no serious damage. At 10 p.m. the only absentees were Nelson and Miss Hind. The latter is reported to have experienced spoke troubles, and has returned to Exeter to have them replaced. She subsequently arrived at Taunton late

at night. The following competitors have reached the London Hotel, Taunton:

M. W. Randle (10 Lagonda)	A. H. Ormerod (5 F.N.)
W. H. Wells (5 Vindec)	T. K. Hastings (5 Indian)
J. Tassell (3½ Matchless)	J. O. M. Dixon (3½ Vindec)
W. Ridler (6 Leader)	R. Moore (3½ P. and M.)
S. W. Carty (3¾ N.S.U.)	W. Milnes (3½ P. and M.)
A. D. Nicholson (3½ Triumph)	H. H. Dommett (3½ Triumph)
G. Gibson (3½ Triumph)	R. King (3½ Triumph)
F. Dover (3½ Triumph)	J. Haslam (3½ Rex)
F. S. Barnwell (3½ Rex)	Capt. Sir R. K. Arbuthnot,
Dr. H. R. Mayo (5 Vindec)	Part., R.N. (3½ Triumph)
M. Geiger (6 N.S.U.)	Rev. L. Cutler (3½ Triumph)
T. F. Cox (7 Minerva)	H. Ellison (1¼ Motosacoche)
F. C. Mustard (3½ Triumph)	J. V. Robinson (1¼ Motosa-
C. E. Murphy (3½ Triumph)	coche)
W. H. Outwin (3½ Triumph)	W. F. Merritt (3½ Triumph)
E. Gwynne (5 Vindec)	J. E. Adam (3½ Triumph)
W. W. Douglas (2¾ Douglas)	G. L. Fletcher (2 Moto-Rêve)
P. Phillips (2¾ Douglas)	W. Smith (2 Moto-Rêve)
E. Clark (2¾ Douglas)	C. A. Palmer (4 Roc)
R. W. Duke (3½ Triumph)	W. Newman (4 Roc)
H. C. Hanrott (3½ Triumph)	A. D. Powell (3½ B.P.)
A. M. Lomax (3½ Triumph)	H. B. Lewis (3½ Triumph)
O. C. Godfrey (3½ Rex)	A. M. Tatham (3½ Matchless)
A. J. Sproston (5 Rex)	P. Weatherhilt (3½ Zenette)
G. Lee-Evans (3½ Rex)	F. W. Barnes (3½ Zenette)
F. W. Applebee (5 Rex)	A. F. Wilding (6 Bat-J.A.P.)
J. Slaughter (3½ Triumph)	A. D. E. Craig (5 F.N.)
J. Marshall (3½ Triumph)	H. D. Seale (3½ Triumph)
P. H. Cockcroft (3½ Triumph)	H. R. Dougal (5 Vindec)

Up to the end of the first day the following record of the performances of the riders has been published by the judges. Those that have lost no marks are:

G. Lee-Evans	J. O. Robinson	T. F. Cox
J. Marshall	W. F. Merritt	F. C. Mustard
O. C. Godfrey	J. C. Adam	C. E. Murphy
A. J. Sproston	W. Smith	W. H. Outwin
P. H. Cockcroft	C. A. Palmer	E. Gwynne
F. W. Applebee	W. Newman	P. Phillips
J. Slaughter	A. D. Powell	E. Clark
A. H. Ormerod	H. B. Lewis	R. W. Duke
T. K. Hastings	M. W. Randle	H. C. Hanrott
R. Moore	W. H. Wells	A. M. Lomax
W. Milnes	J. Tassell	A. M. Tatham
H. Dommett	S. W. Carty	S. Weatherhilt
R. King	A. D. Nicholson	F. W. Barnes
J. Haslam	G. Gibson	A. F. Wilding
Sir R. K. Arbuthnot	F. Dover	A. D. E. Craig
L. Cutler	F. D. Barnwell	H. D. Seale
H. Ellison	M. Geiger	H. R. Dougal

Lining up for the departure from Land's End on Monday morning, July 13th. Among others are W. H. Wells, A. G. Reynold, E. Nelson, and E. Gwynne.

Auto Cycle Union End-to-end Reliability Trials.—

The following riders have been penalised:

W. Ridler, 18 marks.

E. Nelson, arrived Taunton Tuesday a.m.

H. R. Mayo, 96 marks.

Miss Hind, arrived Taunton 11 p.m. Monday.

J. O. M. Dixon, 30 marks (repairs in control).

G. L. Fletcher, 42 marks (Sec. II., 19 marks late; Sec. III., 23 marks early).

It will be noticed that, despite the severity of the first day's run, the percentage of those who lost no marks was exceptionally high.

SECOND DAY, Tuesday, July 14th.—Taunton to Warrington, 199½ Miles.

A fine morning again welcomed the competitors, but the weather showed indications of being changeable. All those whose names have been recorded above left the London Hotel, the first batch being sent off at 8 a.m. In other words, all who left Land's End on Monday duly started on the second day, on which the largest number of miles in any one day's run was covered. The 40 h.p. Napier, owned and driven by Mr. G. H. Levick, bearing Messrs. Watson, J. W. G. Brooker (judge), B. H. Davies (marshal), J. Edge (*The Motor Cycle* photographer), E. M. P. Boileau (*The Motor Cycle*), and the chauffeur—a goodly load—left Taunton somewhat late, but, thanks to the efficiency of the car and the skilful driving of its owner, who made up time where the roads were clear, and yet drove without inconveniencing anyone, we forged gradually ahead, and got well in front of the men, reaching Red Hill, nine miles from Bristol, in time to see them make the ascent. From Taunton on, the roads were, in contrast to those traversed the day before, far more smooth and straight. All through the country rain had fallen, but most of the showers had been purely local, so that the surface was alternately dry and wet. During this trial the Union, wisely or unwisely, decided to have no timed hill-climbs, but it was determined to make careful observations of the performances of the men on several stiff ascents. Red Hill is approached after a severe climb over the miniature mountain pass by means of which the Mendips are crossed, then follows some undulating country, and lastly comes the hill itself. It is long, but not exceptionally steep, and consists of a long pull of one in twelve to one in fifteen or thereabouts, a short, easy portion, and finally a second steep section. Chiefly on account of its length (one mile), the hill may be called severe, and two years ago it proved to be the downfall of many of the competitors. This year, however, we are happy to be able to record that the number of failures was remarkably small, and the percentage of very successful ascents exceedingly high, proving that in two years' time the improvement in the hill-climbing properties of motor cycles has been considerable.

Red Hill, near Bristol.

Some remarks on the hill-climbing performances of the machines entered may prove interesting:

J. Tassell (3½ h.p. Matchless).—Good.

S. W. Carty (3¾ h.p. N.S.U.).—Good; changed up from lower gear as soon as gradient eased.

A. D. Nicholson (3½ h.p. Triumph).—Good.

F. C. Mustard (3½ h.p. Triumph).—Very good.

A. M. Lomax (3½ h.p. Triumph).—Pedalled; engine knocking slightly.

W. Douglas (2¾ h.p. Douglas).—Good; light pedalling.

E. Clark (2¾ h.p. Douglas).—Very good.

A. J. Sproston (5 h.p. Rex).—Fast; very good.

W. Ridler (6 h.p. Leader).—Pedalled slightly.

P. H. Cockcroft (3½ h.p. Triumph).—Good.

G. Lee-Evans (3½ h.p. Rex).—Good.

R. Moore (3½ h.p. Phelon and Moore).—Good; low speed.

W. H. Wells (5 h.p. Vindec).—Excellent; to all outward appearances the best performance.

T. K. Hastings (5 h.p. Indian).—Good.

W. Milnes (3½ h.p. Phelon and Moore).—Good; low speed.

F. W. Applebee (5 h.p. Rex).—Very good.

F. Dover (3½ h.p. Triumph).—Very good.

M. Geiger (6 h.p. N.S.U.).—Excellent performance marred by switching off as soon as he saw the officials (a failing of his).

H. Dommett (3½ h.p. Triumph).—Engine knocking.

W. H. Outwin (3½ h.p. Triumph).—Good.

Sir R. K. Arbuthnot (3½ h.p. Triumph).—Good.

G. Gibson (3½ h.p. Triumph).—Pedalled hard.

G. L. Fletcher (2 h.p. Moto-Rève).—Good; pedalled slightly.

P. Phillips (2¾ h.p. Douglas).—Good; pedalled slightly.

C. E. Murphy, J. Slaughter, and J. Marshall (all riding 3½ h.p. Triumphs) dismounted at the inn, two-thirds of the way up the hill, for refreshment. They all restarted a few minutes after on the gradient in excellent style.

H. C. Hanrott (3½ h.p. Triumph).—Good.

A. F. Wilding (6 h.p. Bat).—Excellent.

H. D. Seale (3½ h.p. Triumph).—Very good.

The only passenger motor cycle which started on the long journey from End to End. M. W. Randle (10 h.p. Lagonda) being timed away by F. Straight, the A.C.U. Secretary.

Dr. Mayo (5 h.p. two-speed Vindec).—Very good.

R. King (3½ h.p. Triumph).—Engine knocked slightly.

J. Haslam (3½ h.p. Rex).—Good.

J. N. Robinson (1¾ h.p. Motosacoche).—Pedalled.

F. W. Barnes (3½ h.p. Zenette).—Good.

W. Newman (4 h.p. Roc).—Good.

C. A. Palmer (4 h.p. Roc).—Good.

H. B. Lewis (3½ h.p. Triumph).—Good.

P. Weatherhilt (3½ h.p. Zenette).—Good.

W. F. Merritt (3½ h.p. Triumph).—Missing.

H. D. Powell (3½ h.p. two-speed Fittall).—Good; changed up when gradient eased, and then changed down for the last section.

A. D. E. Craig (5 h.p. F.N.).—Splendid.

A. M. Tatham (3½ h.p. Matchless).—Good.

L. Cutler (3½ h.p. Triumph).—Good.

H. R. Dougal (5 h.p. Vindec).—Good.

J. E. Adam (3½ h.p. Triumph).—Good.

H. Ellison (1¾ h.p. Motosacoche).—Dismounted.

T. F. Cox dismounted at the first attempt, but later rode to the foot and ascended in good style.

The official at the summit reported that H. B. Lewis (3½ h.p. Triumph) and one of the Motosacoche riders dismounted.

Auto Cycle Union End-to-end Reliability Trials.—

After leaving Red Hill, the men had a splendid run mostly downhill, when after a few miles a *détour* was made through a pretty winding road to the outskirts of Bristol, where there was the first check of the day.

Negotiating Bristol and its Trams.

Here the men were splendidly piloted across the Avon and along its banks, then under the suspension bridge and up the steep hill on to the Clifton downs.

A. F. Wilding, holder with M. J. G. Ritchie of the lawn tennis doubles championship, giving his 6 h.p. Bat-Jap a short rest near Exeter.

All the thick traffic was avoided, and save for a few yards, where the road was up for the laying down of tramlines, all was plain sailing. It was all splendidly managed, and Bristol, which is usually a bad town to traverse, was made quite easy. Then followed an excellent run over roads alternately wet and dry through Gloucester and Tewkesbury to Worcester. There were one or two slight showers, but, taking it as a whole, the going was good. At Worcester (256¾ miles from the start, and 104¼ miles from Taunton) a halt was made for lunch. Here a number of people came to see the men, among whom we noticed Mr. and Mrs. Schulte, and Messrs. F. Hulbert and I. B. Hart-Davies. Miss Hind had again much trouble with her clutch, and Dr. Mayo, the possessor of the unlucky number 13, had had his carburetter on fire on several occasions. J. Tassell experienced punctures, J. O. M. Dixon loose spokes and other troubles, but, on the whole, most of the *pannes* were of a trivial nature. After lunch the going to Kidderminster was excellent, but after leaving this town two severe hills had to be negotiated. The first of these, which is the steeper, had a very loose surface, and on it and its fellow many spectators had congregated. All the way along the route great enthusiasm was displayed, and through Gloucestershire, Worcestershire, and Shropshire the police gave every possible assistance, and carefully guarded the cross roads. In Cheshire, however, they were slightly inclined to treat the matter differently. From Bridgnorth onwards the same road conditions prevailed, and in Shifnal, which is approached by a steep hill, followed by a right-angle bend, part of the road was up, and nearly everyone had to dismount. Just outside Wellington a rainstorm of exceptional

severity was encountered, but from this town to the destination for the day the roads were good and wonderfully straight. Warrington turned out in its thousands to witness the arrival of the men, but some difficulty was experienced in accommodating them. The machines were garaged in the yard of the Lion Hotel. At 11.15 p.m. all have arrived except Messrs. Ridler, Randle, Nelson, and Cutler. Randle's delay is due to ignition troubles, and Cutler's to a burst tyre.

At the end of the second day's run the following competitors lost no marks:

W. H. Wells	H. C. Hanrott	L. Cutler
J. Tassell	A. M. Lomax	H. Ellison
S. W. Carty	G. Lee-Evans	W. F. Merritt
A. D. Nicholson	O. C. Godfrey	J. E. Adam
G. Gibson	F. W. Applebee	G. L. Fletcher
F. Dover	A. J. Sproston	W. Smith
F. S. Barnwell	J. Slaughter	C. A. Palmer
Dr. Mayo	J. Marshall	A. D. Powell
M. Geiger	P. H. Cockcroft	H. B. Lewis
F. C. Mustard	A. H. Ormerod	A. M. Tatham
C. E. Murphy	J. O. M. Dixon	P. Weatherhilt
W. H. Outwin	R. Moore	F. W. Barnes
E. Gwynne	H. H. Dommett	A. F. Wilding
W. Douglas	R. King	A. D. E. Craig
P. Phillips	J. Haslam	H. D. Seale
E. Clark	Sir R. K. Arbuthnot	H. R. Dougal
R. W. Duke		

Marks have been lost by the following men:

M. W. Randle and E. Nelson, not reported on Tuesday night; have probably retired.

T. F. Cox, 9 marks; section early.

Miss Hind, 83 marks; repairs to clutch in garage.

T. K. Hastings, 8 marks; section early.

W. Milnes, 11 marks; section early.

J. V. Robinson, 13 marks; late in section.

W. Newman and W. Ridler not reported. Newman arrived at 9.20, after being delayed by a choked carburetter.

THIRD DAY, Wednesday, July 15th.—Warrington to Moffat, 158¾ Miles.

After sorting themselves out from the various hotels and lodgings in this town of cobble stones and tramlines, the competitors congregated at the Lion, and left at 8 a.m. All the previous arrivals started except Ridler. For the first hour busy towns thronged with trams and other traffic had to be negotiated. The streets were paved with badly worn cobbles, and in places the surface was execrable. Between the towns, however, the going was passably fair, but Preston

THE machine for Side Car work.

2, Ash Place, Newcastle Road,
Sunderland, July 1st, 1908.

Dear Sirs,

I am pleased to inform you that my 4 h.p. N.S.U. which I rode in the 1906 End to End Trial is still going as strong as ever. In the Sunderland and District Motor Cycle Club's Reliability Trial held on the 24th June, to Doncaster and back a distance of 220 miles, I completed the journey well up to time at all controls and without the loss of a single mark, qualifying for the "Vaux Cup" and Silver Medal. The machine ran perfectly throughout and required no adjustment whatever. I enclose cutting from the *Sunderland Echo* for your perusal.

Wishing you every success,
Yours sincerely,
(Signed) S. WILSON.

Auto Cycle Union End-to-end Reliability Trials.—

proved troublesome. The check was at the entrance to the town, and owing to the A.C.U. flag not being in a very conspicuous position several of the men passed it by, got well into the town, and had to come back. Outwin was run into by a cart, which passed over his front wheel. Douglas, on the $2\frac{3}{4}$ h.p. Douglas, found the bad surface rather too severe on his front forks, which broke and threw him over, fortunately without damaging him seriously.

The traffic in Preston was considerable, but once through it the competitors had excellent roads for the rest of the day's journey. At Broughton, four miles out, two competitors reported they had missed the

spicuously good. These were, as far as can be told simply by observation, made by:

P. H. Cockcroft ($3\frac{1}{2}$ Triumph)	P. Phillips ($2\frac{3}{4}$ Douglas)
M. Geiger (6 N.S.U.)	J. E. Adams ($3\frac{1}{2}$ Triumph)
W. H. Wells (5 Vindoc)— excellent	Miss Hind (5 Rex)
R. M. Moore ($3\frac{1}{2}$ P. and M.)	A. H. Ormerod (5 F.N.)
T. K. Hastings (5 Indian)	A. D. E. Craig (5 F.N.)

A few riders of the lightweights had to pedal rather vigorously, but we only observed one failure, namely, that of H. Ellison ($1\frac{3}{4}$ h.p. Motosacoche—the smallest machine in the competition). The surface of the hill was better than we have seen it before, and the roads got better and straighter as the journey North was continued. In Penrith a real genuine police trap in

In the hotel yard at Warrington. Some of the Trials Competitors ready to start.

Preston check, and had their cards viséd by an official who happened to be near. From Broughton to Kendal the police were reported to be very active, but no one was stopped. Randle, who did not arrive till the men were being despatched from the night's stopping place, was last seen at Kendal, where lunch was served at the Railway Hotel. During the morning's run several men were seen stopped by the roadside, but most of their troubles were of a trivial nature, and, on the whole, the machines are doing exceptionally well, and are proving themselves to be vastly superior as regards hill-climbing in comparison with those which competed two years ago.

The Climb up Shap Fell.

From Kendal to the top of Shap Fell the road rises steadily, but not continuously, until the foot of the hill proper is reached, where a gradient of about one in ten is encountered, which afterwards eases rapidly. There being nothing to prevent them, most of the men allowed their engines to cool before tackling the final section. The performances up Shap were so satisfactory that we shall only mention those whose performances are con-

good working order was discovered, and duly proved to be the real article by E. Clark, Miss Hind, and A. J. Sproston, and the two latter were accused of travelling at the rate of one-eighth of a mile in 22s. The officials in Mr. Starley's Rover discovered this "control," and warned most of the other competitors.

A Good Day's Run.

From Penrith right up to Moffat the going was magnificent, the roads were straight and remarkably smooth, and with the wind behind them the men had all they could do to keep the pace down. All day the rain kept off, and the weather was fine but cold, and devoid of sunshine, but a heavy downpour was experienced by all but the earliest arrivals at Moffat. With regard to the troubles experienced by some of the competitors, Phillips, the rider of the other Douglas, broke the forks of his machine near Shap, and had to retire. Both the Douglas machines are therefore *hors de combat*. Miss Hind experienced no further trouble, but the back wheel of her machine is sadly out of truth. F. W. Barnes had five punctures; L. Cutler had six punctures and a broken exhaust valve, which for a

Auto Cycle Union End-to-end Reliability Trials.—

long time refused to be withdrawn; Applebee's pulley flew off; and one of the Roc riders had a troublesome short in his magneto. At dinner time at Moffat a wire was received from Nelson to say he had been on the road since 3 a.m., his carburetter had caught fire, but he hoped to arrive that night. Randle arrived very late, hopelessly out of the competition and wet through, but plucky, and determined to finish somehow. The idea of utilising Moffat as a stopping place is a good one, as it is a delightful spot among the lowland hills; the hotel, the Buccleuch Arms, is excellent, and the people are most anxious to render the competitors all the assistance possible. Taking it as a whole, the day's run has been a most successful one, and the easiest of all so far. Up to the present all has passed off most successfully, and the management is excellent. B. H. Davies, who has been assisting the officials, had to leave at Carlisle, much to his disappointment. For the first part of the day's run we rode on the 14 h.p. N.A.G., a new car, which, if it meets with the success it deserves, will soon become popular, and will appeal to those motor cyclists upon whom fortune smiles and enables them to invest in a more imposing vehicle.

FOURTH DAY, Thursday, July 16th.—Moffat to Pitlochry, 137½ Miles.

This day's run was ridden in rain throughout and over soddened roads. Twelve miles uphill faced the riders from the start, and owing to the falling rain very little interest was, we fear, taken in the surrounding scenery. Miss Hind, who is riding with indomitable pluck and perseverance, unfortunately experienced trouble just before Perth with a buckled back wheel.

She waited in Perth for the wheel to be repaired, and left that town at 3 a.m. on Friday, arriving at Pitlochry at 7 a.m. We understand that while the wheel was repaired at a garage she took forty winks, and resumed the journey immediately the machine was ready.

Some of the riders ascending Shap at a fast speed. Note the interested motor cycle spectators.

The marks lost on the four days' running are as follows:

Eli Clark (2¾ h.p. Douglas)	81 marks
A. J. Sproston (5 h.p. Rex)	33 "
Leofric Cutler (3½ h.p. Triumph)	42 "
G. L. Fletcher (2 h.p. Moto-Rève)	218 "
P. Weatherhilt (3½ h.p. Zenette)	37 "

The following retired this day:

T. F. Cox (Minerva)	W. Newman (4 Roc)
H. Ellison (1¾ Motosacoche)	A. D. Powell (3½ B.P.)

No official reports were issued on the performance of the following:

Miss Muriel Hind (5 Rex)	E. Nelson (5 Rex)
H. R. Mayo (5 Vindec)	M. W. Randle (10 Lagonda)

Two views of one of the official cars. Mr. G. H. Levick's 40 h.p. Napier. It will be noticed the car is fully loaded.

Auto Cycle Union End-to-end Reliability Trials.—

The non-starters were W. Ridler (6 h.p. Leader); E. Nelson (5 h.p. Rex), who never turned up despite the telegram referred to in our report of yesterday; and of course Douglas, whose retirement has been reported. Phillips, who was stated to have retired, repaired his machine and started with the others, as also did Randle. From Moffat the competitors ran back south for about

Mr. J. K. Starley's 20 h.p. Rover official car at Land's End. Mr. Straight is seated beside the owner.

a mile, and then just north of Beattock took a very sharp turn to the right and joined the Glasgow Road. The surface was magnificent, the wind behind the men, and the road so beautifully graded, that it was hard to believe that Beattock summit was 650ft. above the level of Moffat. Through Crawford and on the roads were so excellent that the men had great difficulty in keeping their speed down; in fact, we came upon a large batch of riders just outside Lanark who were considerably ahead of minimum time, and one of them who is notorious for always keeping in the front rank crouched down behind the parapet of the bridge over the Clyde, on which his machine was standing, as the official car came by, much to the amusement of the occupants, who saw it all.

At Lanark, the first control, the sky became overcast and rain began to fall heavily, rendering the rest of the day's run (which was fortunately comparatively short)

as miserable as could be. The good going met with on the previous section was over and done with, and mud, slosh, and greasy roads, and all the abominations of the colliery districts through Newmains, Carlisle, and such like towns had to be encountered. The surface at times was abominable, but except in and near the towns the roads were not of a particularly slippery nature. Lunch was served at the Station Hotel, Stirling, where the second check was situated. The checker, however, failed to turn up. Fortunately, the Rover with Straight, Reynolds, and Macdonald on board arrived in good time, and took over the matter promptly. The rain still came down, and the road conditions were worse than ever, causing the coloured tam-o'-shanters to run and dye the men's clothing, while the mud was inches deep in places. It was an unfortunate day for many of the men. In the morning Newmains (4 h.p. Roc) had trouble with the ball bearing of the connecting rod and had to retire. He was towed seven miles to the nearest station by his *confrère*, Palmer, riding a twin-cylinder Roc, who accomplished this Samaritanlike action without losing a mark. Cox (7 h.p. Minerva) retired owing to engine trouble and a side-slip. In Aberfeldy, Craig (5 h.p. F.N.), who hitherto had had no trouble at all, broke down, and after trying everything, walked into Pitlochry, arriving there just before 9 p.m. At Dunkeld, Fletcher (2 h.p. Moto-Rêve) broke fork spring, and is said to have withdrawn. At Perth, Ellison (1¼ h.p. Motosacoche) burst his back tyre. Phillips's Douglas again suffered a breakage, and he has had to withdraw. A. D. Powell (3½ h.p. B.P.) had trouble with his two-speed gear, owing to some odd size balls being put into the gear with the grease, the fault of a careless assembler, most of the teeth of the gear wheels are stripped. Hitherto Dr. Mayo, M. Randle, and Miss Hind have lost all the marks they could possibly gain, but they hope to struggle on and qualify for a bronze medal. Despite the above troubles a large number of riders have lost no marks. It is to be hoped that the weather will improve for to-morrow and the last day, as the scenery is magnificent if the sun is shining.

In addition to the list on the previous page, marks were lost by:

W. Ridler (6 h.p. Leader), W. W. Douglas (2½ h.p. Douglas), and P. Phillips (2½ h.p. Douglas).

Group of survivors at Moffat, after completion of 511 miles in three days. Up to this point only five competitors had retired.

Auto Cycle Union End-to-end Reliability Trials.—

FIFTH DAY, Friday, July 17th.—Pitlochry to Tain, 134 Miles.

Thursday had indeed been a trying day, but on Friday morning, with the sun struggling to come through the clouds, and here and there a patch of blue sky, the competitors little knew what they were about to encounter. At 8 a.m., when the men were sent off, the sky looked threatening, and a typical Scotch day seemed imminent, which means that windy showers are to be expected over the Grampian Pass. From Pitlochry through Blair Atholl the road was much improved, and a steam roller was seen doing good work. Here and there it rained fitfully, but it kept fairly fine, and the roads were not very slippery until Struan was reached. Here the real climb begins, the country becomes desolate and barren, yet the scene is impressive, but the road deteriorates greatly. For stretches the surface is quite good, and then it is loose, especially at the corners. The ascent continues gradually without any very severe gradients, until the summit at Dalnaspidal, about 1,500 feet above sea level, is reached. The road is also narrow, and was quite unpleasantly greasy at times, and this, together with the fact that a strong north-easterly wind blew down the route, greatly added to the discomfort of the riders.

At Dalnaspidal it rained heavily, and continued for some time. At times the distant mountains looked grand through the mist and rain, but all the beauties of the Drummochter Pass, so conspicuous on a sunny day, were absent. After Newtonmore the rain eased a trifle, and a glimpse of two of the pretty lochs situated between Aviemore and Carrbridge was afforded. From Aviemore on there are no very long hills or steep gradients until Carrbridge is reached, but the road is apt to be somewhat rough. At Carrbridge there is an exceedingly long and stiff pull over the mountains, and a further stretch of barren, exposed, and yet beautiful country has to be traversed. The rain here descended in sheets, drifting across the route and rendering the surface of the roads a perfect quagmire in places. Here and there men were seen temporarily stopped by the roadside, and a good deal of trouble was experienced. This section was particularly trying, and how the men got through it at all is difficult to understand, as the roads were exceptionally hilly and the gradients were all the more difficult to negotiate owing to the thick mud, rain, and cold head wind.

The writer has been through every A.C.U. Trial since the first one in 1903, and he has never seen such weather or such roads. The fearful day—Stamford to Scarborough—in 1904 was as nothing to it. All are showing extraordinary pluck and determination, and yet many had to get off and push through the mud. On one patch one man, who was driving down the long hill into Inverness with his throttle almost shut, had the engine suddenly stop in reaching one of the worst patches of mud, entirely owing to the increased friction caused thereby. Despite these trials the vanguard reached the Station Hotel at Inverness with the punctuality of a train. Half-drowned and tired of the weather, the men had luncheon and started out on the last section of the day's run. It was no ordinary run of eighty-nine miles between breakfast and luncheon, as it entailed climbing two mountain passes, many other severe hills, encountering heavy

rain and strong head wind, and roads of the worst possible description. All through luncheon time as the men came in one by one it poured in torrents, and so bad were the weather conditions that the men were told they need not adhere strictly to minimum time during the afternoon section, and have extra time to clean their machines on their arrival—a pronouncement which afforded them no small amount of comfort. Just as the first batch of riders was leaving the Highland capital Miss Hind arrived, loudly cheered by the other competitors and onlookers. From Inverness to Tain the weather conditions improved greatly. There were a few showers, and after a few miles the roads improved and became smooth and hard. If only the sun had shone it would have been a glorious run. All along the shores of the Beaully and Cromarty firths the scenery is beautiful, and was fair to look upon even in the gloom and cold.

Naturally, a good many people have been in trouble. Milnes (3½ h.p. P. and M.) had his tank filled up with water instead of petrol. It appears a car driver had been replenishing his radiator from a petrol can filled with water, and a garage man had taken this up by mistake, and had poured it into Milnes's tank, with the result that he was threequarters of an hour discovering the trouble and remedying it. Outwin (3½ h.p. Triumph) had several falls through the greasy condition of the roads, and had his magneto down. Barnwell (3½ h.p. Rex) had the low speed out of action, and his luggage carrier broken. Weatherhilt (3½ h.p. Zenette) wired from Carrbridge that his coil is shorting internally, and he is thought to have retired. Randle had a puncture, and has almost entirely worn away the teeth of the sprockets of his tricar owing to grit from the muddy roads. Cutler (3½ h.p. Triumph) has had bad tyre troubles. Dr. Mayo (5 h.p. Vindec) was misdirected, ran short of petrol, and had to push two miles. Miss Hind (5 h.p. Rex) arrived at about ten minutes to nine. She had had the carburetter on fire, which had given much trouble. Sproston (5 h.p. Rex) had, in company with many others, trouble through wet on the magneto; and Craig (5 h.p. F.N.) had one stop only, due to grit on the high-tension distributor of his magneto. F. W. Barnes (3½ h.p. Zenette) has had carburetter and belt troubles. A conspicuous feature of this severe trial has been the wonderful determination and pluck displayed by all. The organisation has been good throughout, and as an example we may point out that the direction arrows have been printed in two colours—red for a left-hand and green for a right-hand turn.

Marks have been lost by:

F. S. Barnwell, 79. A. J. Sproston, 162 W. Milnes, 13.
H. R. Mayo, 102. F. W. Applebee, 7. L. Cutler, 71.
W. H. Outwin, 8. A. H. Ormerod, 10 H. B. Lewis, 11.
O. C. Godfrey, 18. J. O. M. Dixon, 16

G. L. Fletcher and W. Smith (Moto Rêves) have not arrived at 10.15 p.m.

SIXTH AND LAST DAY, Saturday, July 18th. Tain to John-o'-Groat's, 111½ Miles.

On the morning of the sixth and last day's run all the arrivals of the previous night duly started from Tain at 8 a.m. The road is practically level round the Firth until Bonar Bridge is reached, when there is a stiff rise for several miles; it is then hilly for some distance until sea level is reached at Dunrobin. Some miles beyond hills are again encountered, and the stiff climbs of first the Ord and then Berriedale have to

Auto Cycle Union End-to-end Reliability Trials.—

be negotiated. The weather improved immensely two hours after the start, and the sun shone for the first time for several days. Unfortunately, a north-westerly gale blew down the route with considerable force, rendering the climb over the Ord, 747ft. above the sea, exceedingly trying. All the competitors were stopped on the summit and sent, after a short delay, to Berriedale, four miles further on, this section having to be covered without dismounting, so that the hill could be climbed under ordinary touring conditions. Those who stopped and restarted during this part of the journey were ineligible to compete for the special prize offered for the best ascent of the hill. The worst features of the climb are the first corner immediately over the bridge, where several of the men fell, and the second corner, which was exceedingly sharp and very hard to negotiate. Most of the riders came up in excellent style, and very creditable performances were made by W. H. Wells (Vindec), G. Lee-Evans (Rex), Cockcroft (Triumph), Hastings (Indian), Marshall (Triumph), Gibson (Triumph), and Dommett (Triumph)—all single geared machines; and Milnes (P. and M.), Palmer (Roc), Mayo (Vindec), and Moore riding machines fitted with change-speed gears. It has been decided, therefore, that Mr. A. G. Reynolds's prize should be divided between Dommett (riding a single-gear 3½ h.p. Triumph) and Dr. Mayo (riding a two-speed 5 h.p. Vindec).

After Berriedale came one very steep descent, and then all was plain sailing to Wick, but the wind was very trying. After lunch at Meredith's Hotel, Wick, the competitors proceeded to Keiss, six miles from John-o'-Groat's. From this point Mr. Levick's 40 h.p. Napier led the procession at about eighteen miles per hour to John-o'-Groat's House. On the way Clark (2¾ h.p. Leader-Douglas) was discovered with a broken steering tube. It was exceedingly hard lines

to fail to finish so near the end of the journey.

Leaving the Huna Road at Wart Hill, the men were led over a rather poorly surfaced road to John-o'-Groat's House, and there finished what has been a most arduous but very successful trial. The total number of starters was fifty-eight. Of these, forty-eight finished. Thirty-seven gained gold medals, five silver medals, six bronze medals. Those qualifying for gold medals are:

W. H. Wells (5 Vindec).	A. H. Ormerod (5 F.N.)
J. Tassell (3½ Matchless).	J. O. M. Dixon (3½ two-speed Vindec).
S. W. Carty (3¾ two-speed N.S.U.).	T. K. Hastings (5 Indian).
A. D. Nicholson (3½ Triumph).	R. Moore (3½ two-speed P. and M.).
G. Gibson (3½ Triumph).	W. Milnes (3½ two-speed P. and M.).
F. Dover (3½ Triumph).	H. H. Dommett (3½ Triumph).
F. S. Barnwell (3½ two-speed Rex).	G. King (3½ Triumph).
M. Geiger (6 N.S.U.).	J. Haslam (3½ Rex).
F. C. Mustard (3½ T.T. Triumph).	Capt. Sir R. K. Arbutnot, Bart., R.N. (3½ Triumph).
C. E. Murphy (3½ Triumph).	W. F. Merritt (3½ Triumph).
W. H. Outwin (3½ Triumph).	Dr. J. Ewing Adams (3½ Triumph).
R. W. Duke (3½ Triumph).	C. A. Palmer (5 two-speed Roc).
H. C. Hanrott (3½ Triumph).	H. B. Lewis (3½ Triumph).
A. M. Lomax (3½ Triumph).	A. M. Tatham (3½ Matchless-Jap).
G. Lee-Evans (3½ Rex).	A. F. Wilding (6 Bat).
O. C. Godfrey (3½ Rex).	H. D. Seale (3½ Triumph).
F. W. Applebee (5 Rex).	H. R. Dougal (5 Vindec).
J. H. Slaughter (3½ T.T. Triumph).	
J. Marshall (3½ Triumph)	
P. H. Cockcroft (3½ Triumph)	

Those who qualified for silver medals are:

Dr. H. R. Mayo (5 two-speed Vindec)	J. V. Robinson (1¼ Motosa-coche)
E. Gwynne (5 Vindec)	F. W. Barnes (3½ Zenette, Gradua gear).
A. J. Sproston (5 Rex)	

Bronze medals were gained by:

M. W. Randle (10 Lagonda tricar)	Rev. L. M. Cutler (3½ Triumpa)
E. Nelson (5 Rex)	G. L. Fletcher (2 Moto-Rêve)
Miss Muriel Hind (5 Rex)	A. D. E. Craig (5 F.N.)

The survivors, numbering 48, at John-o'-Groat's House on Saturday evening. Compare this group with the one on page 571, and it will be noticed how few dropped out notwithstanding the severity of the ride and the very adverse weather conditions.

CLUB NEWS.

The Eastern District M.C.

The suggested joint run for clubs north of the Thames will take place on September 13th. Full particulars as to destination, etc., will be forwarded to any club interested. Present hon. sec., F. W. James, 2, Benworth Street, Harley Street, Bow, E.

Hartlepool and District M.C.C.

The result of the hill-climbing competition held on Silent Bank on Wednesday last is as follows: Twin-cylinder Class—1, H. Durkin (F.N.); 2, Dann (Rex); 3, Edwards (Stranton). Single-cylinder Class—1, Smart (3½ h.p. Triumph); 2, Tiffin (Minerva); 3, Fenwick (P. and M.).

Birmingham M.C.C.

The projected inter-club meet of motor cyclists at Stratford-on-Avon, already mentioned in our columns, will be held on the 22nd of August. The Birmingham M.C.C. are the organisers, and twelve clubs have already signified their intention of taking part. Further suggestions from club secretaries as to the programme should be addressed to R. Vernon C. Brook, "Eastgate," Green Hill Road, Moseley.

S.E. Auto Cycle Association.

The committee of the above Association has decided to postpone the penalty run to Saturday, the 25th inst., when the start will be made at 3.30 p.m. from the Green Man, Southend, Catford. Tea at The Retreat, Pole Hill.

The legal department of the Association has already been taken advantage of by an associate member, who joined under the 5s. scheme for unattached riders.

At the last committee meeting, Mr. A. G. Tell was elected to represent the Association in North Wales, where there are already several members.

Richmond and District M.C.C.

The reliability competition for the challenge cup presented by the captain, A. Carpmal, jun., took place on July 11th and 12th, the total distance covered being 183 miles. The members stayed the night at the Burlington Hotel, Worthing. The winner of the challenge cup was F. Cecil Wood, 5 h.p. N.S.U., whose machine was fitted with the N.S.U. side carriage; 2nd, vice-captain K. Lankester, to whom a gold medal will be presented. Unfortunately, the second day's run was marred with heavy rainstorms. The running between the first and second was very exciting, but towards the finish Mr. Lankester mistook the road, thus leaving Mr. Wood winner of the challenge cup. The finish was made at the Burford Bridge Hotel, where supper was partaken of by the members. A combined reliability and flexibility trial will take place on the 26th inst.

Leeds M.C.C.

The official results of the Leeds to London and back reliability trial, held July 11th and 12th, are as follows: 1, E. S. Myers (1907 3½ h.p. Triumph); 2, G. E. Tennant (5 h.p. Vindec); 3, F. W. Greenwood (3½ h.p. Rex); 4, T. G. Bullas (P and M.); 5, Geo. Horner (Royal Cavendish); 6, E. Slater (3½ h.p. Triumph); 7, C. E. Kettle (3½ h.p. Triumph); 8, T. W. B. Durant (Jap); 9, H. Greaves; 10, Tytler; 11, Felix Scriven (3½ h.p. Rex); 12, S. L. Gjertsen; 13, A. Moorhouse (3½ h.p. Triumph). Eight other riders finished in schedule time, twenty-three hours. Myers holds the trophy for one year and obtains a gold medal; Tennant and Greenwood gold medals. Mr. Bullas having made the highest score of any private owner, and not having previously received a gold medal from the Leeds M.C.C., is awarded a solid silver cigarette case, which has been presented to the club by Messrs. Walker and Hall. All members of the Leeds M.C.C. who finished inside schedule time will receive bronze medals.

CHAMPIONSHIP COMPETITION.

At the committee meeting on Friday night last it was decided to alter the date of this competition from July 25th to July 26th, in order that another 202 miles reliability trial could be run.

There will be a reliability trial from Leeds to Bowness and back on August 3rd and 4th, confined to non-trade members. The president has presented a cup for the best performance in the event. Entries to be sent to Mr. Bagshaw, 4, Ash Grove, Headingley, Leeds; entrance fee, 2s. 6d. The president hopes the first non-trade competition will be a great success. There are several other valuable prizes.

Manchester M.C.

The annual reliability trial for motor cycles takes place on Saturday and Monday, August 1st and 3rd, starting from the Trafford Arms Hotel, Old Trafford, 8 a.m. August 1st. The trials will consist of an out and home run to Cheltenham, with a hill-climb during part of the trials, all machines being timed from a standing start.

Newcastle and District M.C.C.

The above club will hold a petrol consumption trial on the 26th inst. near Wooler. A start will be made from the Barras Bridge, Newcastle, at 10.30 a.m., to Wooler for lunch. The trial will be held over a ten miles course, and every competitor will be provided with a special tank to be attached to his machine temporarily. The basis of the formula for deciding the order of merit will be weight propelled, distance, and volume swept out.

West Essex A.C.

The reliability competition for the president's trophy (a valuable shield, presented by Mr. B. Foster Wickens) was held on the 11th inst. Starting from the Artichoke Hotel, Shenfield Common, the course was four times round a fifteen miles circuit, taking in Warley, Cranham, Harold Wood, Upminster, and Ingrave. Two stiff hills, which were in very loose condition, had to be negotiated each round, and these proved the undoing of several competitors. Fourteen members faced the starter. Result: 1, G. W. Glenny (8-10 h.p. Darracq car), trophy and gold medal; 2, R. G. Dendy (3½ h.p. Brown bicycle), silver medal; 3, Ivan C. Brown (3½ h.p. Brown bicycle), bronze medal. Mr. C. D. Makepeace acted as starter and timekeeper. The contest was keenly followed by a good number of members and friends.

Cheltenham and District M.C.C.

The above club held its annual reliability trial for the Walter Unwin Cup on Wednesday, July 15th, the distance covered being seventy-four miles, the cup to go to the rider making a non-stop run, and whose time was nearest to three hours forty-five minutes, watches, speedometers, etc., being strictly barred. The winner proved to be Mr. R. Dance, he being only 23s. over the time. Result:

	H.	M.	S.
1. R. Dance, non-stop	3	45	23
2. D. Hayward, non-stop	3	44	31½
3. A. Cooke, non-stop	3	45	36½
4. C. Shermer, non-stop	3	45	47½
5. W. Mills, non-stop	3	50	32
6. E. Hamlin, non-stop	3	58	45

Timekeepers, Messrs. George Pearce and C. Holland.

The competitors and officials were afterwards entertained to tea at Arle Court by invitation of the president, Mr. Walter Unwin.

Bradford M.C.C.

The above club held its annual reliability trial, Bradford to London and back, on the 11th inst. Out of the seventeen entrants fifteen started, and twelve got through in schedule time, these being in order of merit as follows:

	Marks lost.
Eric S. Myers (Triumph)	X
G. E. Tennant (Vindec)	8
T. G. Bullas (Phelon and Moore)	11
E. Slater (Triumph)	13
H. Greaves (Triumph)	28
F. M. Scriven (Rex)	36
W. Jowett (Scott Jowett)	63
T. Briggs (Phelon and Moore)	76
P. Dyett (Triumph)	76
A. H. Forbes (Triumph)	83
Law (Rex)	120
Wild (Rex)	120

The prizes awarded for this competition were 1st (the Wm. Briggs Trophy) valued twenty-five guineas, 1st, 2nd, and 3rd gold medals, and bronze medal for all competitors finishing in schedule time. Mr. S. Johnson, as vice-president of the club, acted as timekeeper and starter. Messrs. Musgrave, Watmough, Woodward, and Hargreaves, being checkers at different places on the route, and were taken down by the official car very kindly lent by Mr. B. Downs. The chief hill-climb of the year, which is one of the most important in the North of England, takes place at Wass Bank on Saturday next, July 25th, for the Dyson Shield.

OCCASIONAL COMMENTS.

By "IXION."

Gear and Power.

I heard it asked the other day why four-cylinder motor bicycles have a far bigger vogue in the United States than in the old country? Many answers were suggested by an interested circle of enthusiasts, but a side on my own in very hilly country has taught me that I am convinced is the main weight of reason. I was accompanied by three or four men on the popular machines of the day, viz., big twins, geared 4 to 1, and $3\frac{1}{2}$ h.p. single-cylinders, geared to a similar ratio. My four-cylinder was geared 6 to 1. We encountered a number of twisty corners on terrifying gradients, and whereas the other machines baulked, had to be taken down and reversed for a fresh rush, or were alternatively assisted by that awkward form of pedalling necessitated when a frame measures only 18 in. and a leg 32 in., my four-cylinder roared round the angles and up the steeps without a falter. It was all a question of gear. And not only was the four-cylinder geared low, but it was the only machine of the bunch capable of being suitably geared, for if the rival machines had possessed the small engine pulleys essential for a 6 to 1 gear, they would have eaten up two belts apiece per diem. Hence the popularity of the four-cylinder in the States. Road conditions there are often vile; full engine power at low road speeds is a pouring necessity; and a belt drive cannot efficiently supply this combination. Hence the vogue of the machine with a gear drive.

My Lubricating Record.

I took out the other day a 6 h.p. twin. the engine of which had just been dismantled for cleansing, and had been found to contain heavy carbon deposits. It had been oiled every five miles for 2,000 miles previously. I decided to see how economically I could run it in the matter of oil, and, using Wilburine, I actually covered 104 miles as near as I can estimate on only four charges. The first charge was put in at starting, and the next was injected after thirty-four miles. The big twin-cylinder engine showed no signs of calling for it, but I was growing nervous, my usual practice being to oil engines of this size at least every even or eight miles. The remaining charges were also pure nerves on my part, as I could not detect any deterioration of the running or any increase of sound from the engine. The speed throughout the run

averaged twenty-four to twenty-six miles an hour. I wonder if the extreme delicacy of a beautifully adjusted and handle-bar controlled B. and B. carburetter had anything to do with the oil economy. I could cut down the gas to a nicety, and set the extra air within a millimetre or so of the required opening. I ran the surplus oil out of the engine on my return, and the crank case contained approximately the same amount as when I started. I must repeat the tests, and weigh the starting and finishing quantities.

Pre-ignition and Plugs.

"T. C. A." sends me an account of some instructive sparking plug experiments. He has a $3\frac{1}{2}$ h.p. and a 3 h.p. Triumph. One morning he took out the $3\frac{1}{2}$ h.p. with a sparking plug we will call plug A. On each hill tackled the machine stopped dead near the top, but would restart in a minute or two without attention. He then tried plug A in the 3 h.p. (which had never needed a roadside repair in 12,000 miles). The 3 h.p. climbed hills perfectly on this plug. He then put the original plug from the 3 h.p. (which we will call plug B) in the $3\frac{1}{2}$ h.p. machine, and it climbed hills perfectly, but, on plug A being restored to it, it again suffered from stoppages due to pre-ignition on hills. He thus has two engines and two plugs. One engine will run perfectly on either plug; the other will run on the flat only with one plug, but will run either on the flat or uphill with the other. I understand that the 1907 $3\frac{1}{2}$ h.p. Triumph engine has a slightly higher compression ratio than the 1906 3 h.p., and perhaps one of the plugs rapidly becomes incandescent when the throttle is opened, and it is in use on a high compression engine. The same correspondent has a third sparking plug, which regularly works admirably for distances approaching 1,000 miles, when it suddenly fails. A delay for it to cool effects no improvement at all, but if the plug is taken to pieces without being cleaned, scraped, reset, or in any way altered or adjusted, it will again work admirably for another period of 1,000 miles or so. The explanation of this is not at all obvious, and I should be inclined to say that a gap opens in the insulation and sets up a short-circuit, so that probably if the locking nuts of the packing joint and insulation were tightened without dismantling the plug at all, it would immediately spark again properly.

A group of some of the competitors in the Barnoldswick M.C. Reliability Trials held on the 4th inst.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Front Wheel Stands.

[3430.]—*Apropos* of front wheel stands and mending punctures in front wheel, I always support front of machine by hanging machine on a gate by the handle-bars.

PUNCTURE.

Belt Fasteners.

[3431.]—*Re* the enquiry of 3381, July 1st. I happen to be the user of the fastener in question, having had it handed me by the patentee three or four months ago for trial on my $3\frac{1}{2}$ h.p. Triumph. It has proved to be an advance on any such fitment hitherto used by me, for after a severe test of over 2,000 miles it shows practically no wear. I believe the fastener is to be marketed with an improved fixing screw and extension link suitable for variable pulleys. The patentee and manufacturer is J. B. Dall, Ladybank, N.B.

SATISFIED.

Bevel Gear Transmission.

[3432.]—I should like to ask makers of motor cycles how it is that we do not see more of the bevel gear transmission, as on the F.N. machines. One is constantly hearing of grumbling belt users, and it seems strange to me that the bevel gear and clutch is never offered as a cure.

I should at the same time like to ask why so many of even the best known makers turn out their single-cylinder machines M.O.I.V. and twins A.O.I.V.? Even the reverse, single-cylinders A.O.I.V. and twins M.O.I.V. would be better.

C. E. HOOPER.

Belts.

[3433.]—You have published several letters lately about slipping belts. I was coming home one night last week in a pouring rain from Beddgelert, which is up amongst our Welsh pimple, when I came across a motor cyclist in great distress. He had a leather belt, and what with wet and oil it was just like a string of slippery eels, and he was at his wit's end. As I am one that likes to get there *and back*, I carry a spare belt in case of the unforeseen turning up; so after wiping the slime out of pulley and belt rim, I fitted him up with a rubber belt. He smiled, and said he was no better off, but he would try it. It slipped for the first twelve or sixteen yards, and then it took its grip, and he rode into Bangor a convert to the rubber belt. It was a Lycett's Lyso belt and fastener that had done well over 800 miles. I should like to get "Jupiter" up here in the same corner, and then see how he would shape with his eight feet odd of slime. CC 230.

Running on Naphtha.

[3434.]—It may be of interest to readers of *The Motor Cycle* to hear that I have been running my 3 h.p. Fafnir on crude naphtha distilled from tar. It soots a little when starting up, owing to incomplete combustion, but there is no smell when running. Of course, sooting can be avoided by proper combustion. I am using an ordinary Longuemare carburetter, exactly the same as I used for petrol. The naphtha is slightly heavier than petrol, s.g. about .730, which is not noticeable. I get slightly more power if anything with naphtha than with petrol. I also know of an 8 h.p. launch on the Trent using the same spirit instead of petrol, and it has increased its mileage to the gallon by twenty to twenty-five per cent. The price is somewhere in the neighbourhood of 4d. or 5d. a gallon retail, but definite enquiries should be made at the Yorks. and Lincs. Tar Distillation Co., Standard Buildings, Leeds. Of course the naphtha fetches all paint off the carburetter, which is not much loss, but it will not injure enamel.

CYRIL V. ALBRECHT.

Leaking Batteries.

[3435.]—With reference to Mr. R. N. Morley's letter No. 3397, July 8th, suggesting improvements in batteries, may we point out that the improvements are already embodied in our accumulators? It is a practical impossibility for acid to leak round the terminal lugs, as we not only fit rubbers tightly round, but also fit celluloid grease caps as an additional precaution, thus forming a double preventive. We may say that we always appreciate these letters from practical riders, as being a guide to manufacturers as to the public requirements, and any suggestions tending to the betterment of electrical accessories will always be welcomed by us.

THE AJAX ELECTRICAL ENGINEERING CO.

The Single-cylinder Engine.

[3436.]—Has not the little Grand Prix at Dieppe, France entirely demonstrated that, for efficiency, speed, and reliability the single-cylinder engine on light cars is ahead of two and four-cylinder engines?

The performance on light cars equally applies to motor cycles, both single and passenger machines. For instance in the Cudham Hill-climb, a single-cylinder machine was only a fractional part of a second slower than the fastest twin-cylinder of nearly double the h.p.

It is to be hoped that some makers of French voiturette will be induced to enter in the two days' light car trial that is being promoted by the S.E.A.A. in August, over an interesting southern route, and which will include a time test hill-climb.

D 1617.

[If they do compete it is to be hoped they will be touring cars and not racers. Most of the French voiturettes used in trials are mere skeletons with engines fitted.—Ed.]

Silence.

[3437.]—In writing a few words to you, to me, invaluable paper, may I say that in my humble opinion had motor cyclists paid more attention to your frequent appeals to avoid making unnecessary noise, the quickly disappearing prejudice of the public would have melted away much sooner.

In spite of your warning, the average motor cycle is too noisy. Why should it be heard farther away than a car as it often is? Many will say that there is no room for a large enough silencer on a motor cycle. Now I have a 3 h.p. belt-driven Singer motor bicycle, which has been running since October, 1905. I do not exaggerate when I say that when running against a strong wind I often cannot hear the sound of the exhaust, save for a very faint hiss. People recognise it as something so different from the ordinary machine that they turn round after it passes and stare at it in amazement, as noise has come to be regarded as an indispensable accompaniment of the motor cycle. Cannot we show them that this is a great error? In doing so we shall do ourselves a service as well as them. If one firm can turn out a machine like this, others can. I find noiselessness does not depend on a good silencer alone. I can make a noise if I like. Good compression and full lift of the exhaust valve, with proper timing of valve and spark, make an immense difference. Add to this good driving, of course; and the best of it is that the very things that conduce to silence also make for power and speed.

Singer and Co. do not make motor bicycles now, but mine is a splendid machine. Three years back it had Simm's Bosch magneto and roller bearings to engine, and there was not an atom of play where rollers are fitted—in big end and shaft bearings.

I wonder if many of your readers have Singer motor bicycles, as I see very few. With best wishes for your campaign against noise.

SILENT.

Leaking Petrol Tanks.

[3438.]—Some of your readers appear to have had some difficulty with leaking petrol tanks. I have just had delivered a new machine which on arrival proved to be leaking seriously at the front of the tank, being built into the frame of the machine similar to the Roc. I hesitated about soldering. I scraped away the enamel and applied Fortifix, which is sold in sixpenny tubes. This has effectually stopped the leaking. The firm who supplied the machine said it must have been damaged in transit. The enamel which covered the bad workmanship was intact! Comment is needless.

Trusting this tip may be of service to any of your readers, I beg to subscribe myself
ANONYMOUS.

A Problem to be Solved.

[3439.]—With reference to the recent correspondence on the "abnormal" running of the four-cylinder F.N., my experience may be of some interest to your readers.

I have used one of these machines now for three years. When I first obtained it, it was fitted with one lever to operate both throttle and extra air. I very soon had it changed to a separate control for the extra air, with the very satisfactory results that I could get the engine into this "abnormal" condition at any time, provided the road was suitable.

My theory is that this "abnormal" running is obtained by getting a "perfect" explosive mixture from the carburettor, which is only obtainable at high speeds.

I also think that the even firing of the engine at high speeds obtained by keeping the distributor very clean tends to produce this high speed running of the engine.

In conclusion, may I add a word of praise for this fascinating little engine; my machine is running better now, its third season, than when I got it.
P. U. JOHNSON.

[3440.]—I am much obliged to Mr. Brookes for pointing out the error in my letter *re* the four-cylinder F.N. crank case. I was speaking from memory, as I could not at the time lay my hand on the F.N. booklet. It is two years since I rode the F.N., and my ignorance of how the crank case is made must be put down to the fact that I never had to look inside it (nor, indeed, any other part of the engine) during the 2,000 miles and upwards which I rode it.

Since my last letter I have had the opportunity of looking at a F.N. crank case four-cylinder type. It is divided into four compartments, but the divisions are not complete, and there is room for oil to splash through from the forward to the rearward cylinder. I always found on my model that on referring to the windows in the crank case the oil was higher in the rear cylinder, and the level of the oil was lowered as one proceeded along the cylinders forward.

The manager at the F.N. Agency gave me a very simple explanation of the phenomenon: it had nothing to do with compression or lubrication. He says that once the back cylinder gets really hot and supplies warm air to the carburettor, which produces more efficient carburation, it has the result described.

I admire this for its simplicity, but it does not account for the fact that Mr. Ovington and others only get this result after going down an incline, or with the assistance of copious lubrication. It is, however, very probably the true explanation of this phenomenon's occurrence in single-cylinder engines.

JOHN F. H. TEMPLER.

Design of Exhaust Cams.

[3441.]—I notice "Ixion" is again decrying the old De Dion type of exhaust valve cam and tappet, and would have us believe it soon wears out and the power of the engine is lost. All I can say is the cam and tappet on my 2½ h.p. De Dion are six years old, the originals fitted to the engine. Bushes have come and gone in the connecting rod and the distribution (he is quite right about these bushes), but the cam and tappet are still going, and on comparing the former with a new one with a micrometer gauge recently, only the merest trace of wear was shown—quite inappreciable to the eye, though, of course, both cam and tappet were brightly polished. Really, with all respect to your contributor, there's nothing in it. These De Dion engines have a large margin of strength, especially in the distribution gear, and are beautifully made, and "Ixion" will find that the case-hardening goes deeper than he supposes, and is not a mere "potash

hardening" skin, such as anyone can put on an ignition cam; it is a process lasting a considerable time. My cam and tappet have run over 20,000 miles, probably nearly 30,000 (I haven't kept a log, but I am sure that if properly lubricated any De Dion engine will do this). I am in accord with him on the subject of distribution gear bushes; they are subjected to severe pressures, and get little consideration, as when worn they do not produce "knocking," but rather "roaring," in the valve gears. It is a subject which receives little attention both from the manufacturer and the user. On the former question, however, I think there is and can be no question that the De Dion type is a suitable valve gear, as witnessed by the number of old De Dion and similar engines running at the present day.
G. D. MONICE.

Standardisation of Rims.

[3442.]—Whatever difficulties obstruct the standardisations of most details of the motor cycle, there is surely a clear path open to the adoption of a standard wheel rim. The three subjoined experiences emphasise the annoyance caused me within twelve months by the existing chaos.

I.

Scene: Northampton. Machine: A 3½ h.p. single, with two dicky covers. Sent size and make of rims, with cheque and order, for two new covers to a noted tyre firm. Need urgent, as I was just starting on a holiday. They replied that while their tyres would "fit" my rims approximately, they refused to supply me unless I had a pair of their rims built on to my wheels. Delay of forty-eight hours—deducted from my holiday.

II.

Scene: Hampshire. Machine: Big twin tricar. Rear tyre burst. Obtained two covers of nominally correct size, in turn, by telegraph. Neither would fit existing rim of nominally same size—one being far too small and the other far too large. Delay, seven days—deducted from my holiday.

III.

Scene: Penzance. Machine: 6 h.p. twin. Rode down with old tyre on rear wheel. Had new rubber studded tyre sent down in advance to wait for me. Both tyres and the rim were marked 650 × 65 mm. The rubber studded cover measured 3in. more in circumference than the old tyre and the rim. Result: Unable to start in the End-to-end trial, holiday upset, much money spent to no purpose.

I have had similar misfortunes in the past, and the sickening thing is that no single excuse or justification exists for the fact that a pair of 26in. × 2¼in. covers or rims of different makes may actually vary several inches in their measurements.
B. H. DAVIES.

Lubrication of Tram Lines.

[3443.]—In regard to your remarks *re* greased tramlines, nearly all the acute bends round about here (Forest Gate, E.) are greased daily. I know it only too well to be a fact, as it is impossible for me to take a country spin without first passing a beautiful specimen. How would the Corporation come off in case of a serious accident, caused through this highly dangerous and inconsiderate practice, which would be quite unnecessary if the tramcars were only constructed in a proper manner? I can promise them that if I am brought off there shall be some noise made about it.

While on this road subject, may I ask any reader or otherwise why the various gas companies are allowed to tear up the roads in thousands of places, and then merely pitch the material in and leave it to stand up four or five inches for every road user to have a share in flattening down? This kind of thing is simply unbearable here, as everybody has got the slot-gas craze in the poorer parts, and the flattening process is done so well that it eventually sinks below the level, leaving a kind of trough right across the road. My question is plainly this: Why are the various companies allowed to tear up the roads without replacing in a proper manner?
HARD TRIED.

EXPERIENCES WANTED.

"R. G. P." (Huddersfield) would like readers' experiences with 1908 Minerva automatic G. and A. carburettor.

"R. N. C." (Redditch) is desirous of placing a lightweight motor cycle on the market. The engine would be made by a first-class British maker, and would be provided with magneto and gear drive. He wishes to know if there is any demand for such a machine.

RECENT PATENTS.

By ERIC W. WALFORD, F.C.I.P.A.

A Hinged Footboard.

Platforms are fixed to the side of the chain stays, and these have hinged to them the footrests B, which can be swung out of the way, as shown in dotted lines, when it is necessary to pedal. The stand C can be fixed to the platform A as shown.—W. C. Unwin, No. 22,324, 1907.

A Belt Fastener without Screws.

The feature of this fastener is that it is held in place without the use of screws or bolts. It consists of plates A with sloping ends B, between which lie washers C connected by links D. The plates A are held together by bolts E, which do not pass through the belt, the plates A gripping the belt by means of teeth or tongues F. It will be seen that the pull of the belt tends to draw the washers C out of the confined space in which they are contained. This tends to separate the ends B of the plates, forcing the tongues E firmer into the belt as the pull increases.—E. Liddell, No. 19,828, 1907.

A Variable Speed Gear and Free Engine Device.

This gear is also of the expanding-pulley-cum-jockey type. The tension of the jockey pulley is controlled, as also is the effective diameter of pulley, from a hand wheel A. The hand wheel has connected to it two operating wires B and C, the former acting on the jockey pulley D and the latter on the adjustable pulley flange. This it does in the following manner: On a suitable fixed bracket E is pivoted at F a curved plate G, to which the operating wire C is attached. This bears against

a plate attached to the movable pulley flange H. Thus, when the wire C is pulled upwards the plate G turns about its pivot F, forcing the flange H inwards and raising the gear. When the wire C is slacked right off the flange moves clear away from the inner flange J, allowing the belt to run upon the collar H, which is mounted upon ball bearings. Thus a free engine is obtained when the wire is slacked right off. The pulley faces are provided with detachable plates L, as shown, which can be removed when the pulley wears. The operating wheel A works through screw and nut gearing, so as to pull on one wire C, and slack off the other wire

B, and vice versa.—L. C. Bour, No. 21,415, 1907.

An Infinitely Variable Gear.

This gear comprises an expanding pulley working in conjunction with a movable back wheel, the wheel moving backwards and forwards, as the case may be, to tighten or slacken the belt as the pulley is adjusted. The hand wheel A is operated, which, by means of the rods B, forces the back wheel in either direction in the slides C. By means of the link D and rod E, the crank F is moved when the position of the back axle is changed. This crank F is connected through screw gearing to the movable pulley flange G. Thus, when the lever F is moved, the screw gearing operates to move the pulley flange G nearer to or further from the fixed flange H. In this manner, when the gear is changed the tension of the belt does not vary.—F. W. Barnes, No. 12,131, 1907.

A Two-speed Gear Improvement.

The gear is contained in the back hub as shown, an expanding clutch A being mounted at one end, and adapted to lock the gear solid for the direct drive or top speed. To bring the gearing B into operation, the band brake C is contracted to grip the drum D, which holds the pinions E stationary, allowing the gear to operate. The band brake C can also be expanded up against the brake drum F, which is fixed to the road wheel G. Thus the low speed band brake can be used also for retarding purposes. The control of the band brake is effected by means of the lever H and a double pedal, which is

not shown.—A. W. Wall, No. 9,256, 1907.

As a proof how rapidly a well made article gains public favour, the following figures may be of interest, being the result of the recent M.C.C. London-Edinburgh run: Twenty-one gold medal (two double) and two silver medal winners used Shamrock Excelsior rubber studded tyres; Mr. Chater-Lea also used these tyres on his car, and won a gold medal. Of sixty-eight belt-driven motor bicycles, Shamrock Gloria belts were patronised by thirty-four gold and three silver medal winners, including Mr. S. G. Frost, who won the M.C.C. Cup.

Experience having suggested to the Bosch Magneto Co. that many motor cyclists ruin the magneto bearings by the use of inefficient and deleterious lubricants, the company have decided to market the special lubricating oil they themselves use. This is of two brands—one known as "P" oil being best suited for use in the case of magnetos with plain bearings, and that known as "B" oil for use in ball-bearings. Bottles of either oil can be obtained from 23, Store Street, Tottenham Court Road, W.

Land's End to John-o'-Groat's Run.

POST OFFICE TELEGRAPHS.

Byrne & Son, Ltd., London.

If the Receiver of an Inland Telegram doubts its accuracy, he may have it repeated on payment of half the amount originally paid for its transmission, any fraction of 1d. less than ½d. being reckoned as ½d.; and if it be found that there was any inaccuracy, the amount paid for repetition will be refunded. Special conditions are applicable to the repetition of Foreign Telegrams.

**A MOTOR CYCLE
WEIGHING
ONLY 60 LBS.**

**A PERFECT
MOTOR CYCLE AT
A BICYCLE PRICE.
£19 19 0 complete.
Fitted with Ruthardt
Magneto
£4 10 0 extra.**

THIS IS QUITE THE LOWEST PRICE

at which it is possible to obtain an efficient motor cycle. The "Wolf" featherweight motor cycle is no toy—it is a marvel of sound construction and ingenuity, and with a wonderful hill-climbing capacity. The frame is specially built and the whole machine is British made.

THE "WOLF" FEATHERWEIGHT MOTOR CYCLE.

SPECIFICATION.

ENGINE—A. J. Stevens 2½ h.p.; bore 2½ in., stroke 2½ in.
COIL—Fuller.
ACCUMULATOR—Premier.
CARBURETTER—A. J. Stevens automatic air inlet and throttle combined.
BELT—Best Chrome.
JOCKEY PULLEY—Ball Bearing.
FRAME—22 in. and 24 in.
TANK—To which combined petrol, lubricating oil, and coil compartments are fitted.

WHEELS—26 in. or 28 in.
TYRES—Wasp No. 1, 1½ in. diameter. Made specially by the Dunlop Rubber Co. Ltd.
CONTROLS—Valve lifter and ignition are controlled by one lever; when magneto, extra lever for ignition.
HANDLEBAR—Wide raised, to which a switch of neat design is fitted.
BRAKES—Wasp front and back roller or inverted levers.
FINISH—Best black enamel, lined two colours. Olive green, silver lines 10/- extra.

"Wolf" Tyres made by the Dunlop Rubber Co. Ltd., 2 in. to fit any standard 1½ in. rim 20/- extra. Write for lists.

WEARWELL MOTOR CARRIAGE CO., LTD., WOLVERHAMPTON.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.

York and Lancashire.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northamptonshire, Warwickshire.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.

Worcestershire, Herefordshire, Radnor, Brecknock, Monmouth, Glamorgau, Carmarthen, Cardigan, and Pembroke.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

SECTION X.

Scotland.

SECTION XI.

Ireland and Isle of Man.

EVERYTHING

the Motor Cyclist can want is obtainable from the **PREMIER MOTOR AGENCY**, who have the largest stock of new and second-hand motor cycles in the Trade. A liberal allowance is made for any second-hand machine in exchange for a new one of any make. Send particulars of yours, and an immediate approximate offer will be made.

NEW MODELS.

TRIUMPH $3\frac{1}{2}$ h.p., 1908, magneto	£48 0
TRIUMPH $3\frac{1}{2}$ h.p., 1907, magneto	39 0
N.S.U. $3\frac{1}{2}$ h.p., 1908, magneto, new, 26" wheels	40 0
N.S.U. $3\frac{1}{2}$ h.p., magneto, new, 1908, 24" wheels	40 0

IMPORTANT NOTICE.

Owing to the Holidays, Advertisements for our issue of the 5th August must reach Coventry not later than **FIRST POST** on Thursday, 30th July, to ensure insertion.

MOTOR BICYCLES FOR SALE

SECTION I.

Northumberland, Cumberland, Durham and Westmoreland.

TRIUMPH, 1907, magneto, new condition with spares; £32, or nearest offer. Smart, Murray Street, W. Hartlepool.

SECTION II.

York and Lancashire.

TRIUMPH, 1907, brand new; 35 guineas cash.—Apply, 70, Manuel Street, Goodrich.
21 h.p. Enfield, Longuemare, seen running, reasonable offer.—12, Rockcliffe, E. cup.

41 h.p. Four-cylinder F.N., 1907, as new, 30 guineas, a bargain.—31, Pasture Road, Goole.

13 h.p. Triumph-Minerva, fine little bike, perfect condition; £7 10s.—11a, Albion Street, Brigg.

31 h.p. Triumph, 1908 pattern, magneto, new condition; bargain, £30.—Bridgwater Garage, Leeds.

1907 Twin Rex, splendid order and condition, accessories; £19 10s.—Shorrocks, Earnsdale, Darwen.

1908 $3\frac{1}{2}$ h.p. Brown Motor Cycle, new, shod, soiled; £31 to clear.—Athletic, Park Street, Accrington.

31 h.p. Minerva, magneto, 1908, not ridden, 300 miles, footboards and pedals; a bargain.—Glew Bros., Howden.

NEW Minerva, $3\frac{1}{2}$ h.p., magneto, spring forks, uncrated, 1908 model; with offers.—Pettit, Dentist, Halifax.

1908 Coventry Flyer; cost £7 10s., £6 or exchange with 15s. for motor cycle.—170, Keighley Road, Colne.

FOUR-CYLINDER F.N., unused, latest, 4 h.p., low frame pattern, just delivered, £40, or offer; Yorkshire.—No. 372, The Motor Cycle Offices, Coventry.

31 h.p., Hobart engine, magneto, adjustable pulley, etc., a splendid motor; £22; trailer, £2; Longuemare carburettor, 7s. 6d.—Fortune, solicitor, Harrogate.

In answering any of these advertisements it is desirable that you mention "The Motor Cycle."

MOTOR BICYCLES FOR SALE.

VINDEC Special, 5 h.p., two-speed gear, twin-cylinder, in perfect condition; cost £60, price £35; can be seen and tested.—Vicar, All Saints Vicarage, Coventry.

LADY'S 2 h.p. Minerva engine, in perfect running order, all plated parts, and enamelling as new, tyres in excellent order; £18.—Hulbert, Weston-in-Arden, Nuneaton.

2 1/2 h.p. Noble, Palmer tyres, non-skid bands, lamp, stand, horn, tools, and all accessories, perfect condition; £12, or good cash offer.—Boswell, Aylestone, Leicester.

ROC Twin, 5-6 h.p., open frame, by instructions from Miss Hind at £42; also a 4 1/2 h.p. twin Minerva, £20; and a Bat, spring frame, 2 1/2 h.p., £12.—Roc Motor Cycle Works, Birmingham.

GRAND 1907 3 h.p. Clarendon, equal to new, low frame, long wheelbase, engine, tyres, Grose non-skid, and rubber belt, all absolutely perfect; tried any time; £21.—Marlow, Franklyn House, Desborough.

3 1/2 h.p. Clarendon, latest, low model, hardly soiled, and guaranteed perfect, exceptional fine machine; cost £37 10s.; exchange for lower power and cash, or good push bike and cash.—22, Catherine Street, Coventry.

3 h.p. Chater-Lea-Fafnir, magneto (Bosch), powerful, perfect, simple, reliable, long, low frame, F.N. carburetter, Duco belt; expert examination; Michelin tyres, as new; any trial here; £19; photo.—English, Hardwick, Lincoln.

TRIUMPH, 1908, in splendid condition, registered, fitted, horn, acetylene lamp, with spare valve, sparking plug, contact points, usual tools, etc.; ready for the road.—Cash offers to No. 359, *The Motor Cycle* Offices, Coventry.

3 1/2 h.p. Vindec Special, magneto, Peter-Unions, detachable tubes, spring forks, adjustable pulley, B100, Shamrock belt, carrier, stand, all tools, spares, etc.; £26, or nearest offer.—Russell, 14, Henry Street, Peterborough.

ARIEL! Ariel!! Ariel!!!—For immediate delivery, the 2 1/2 h.p. lightweight; write for catalogue and full particulars; also 3 h.p. and 5 h.p. twin-cylinder models; a few 3 h.p. and 5 h.p. twins at clearance prices.—Ariel Works, Bournbrook, Birmingham.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

2 h.p. Minerva, spray, M.O.I.V., spring seat, light, low; £8.—Sconce, Lynn.

3 1/2 h.p. Brown, 1907, Bosch magneto, all in sound condition; cheap. £20.—Wallis, grocer, Hills Road, Cambridge.

MOTOSACOCHE, Laurin-Klements, 1908 machines; bargain prices, special terms.—Bone, Ashburton, Wells, Norfolk.

HUMBER 2 1/2 h.p. Motor Cycle, good running order, free engine, new cover back wheel, all accessories, lamp; £15.—Dr. Job, Newark.

3 1/2 h.p. N.S.U., magneto, and Millford sidecar, castor wheel, splendid condition, two lamps; £35; buying car reason of selling.—S. Wright, York Street, Luton, Beds.

3 h.p. Raleigh, Fafnir engine, new Palmer tyres and Watawata belt, handle-bar control, Longuemare; any trial; engine as new; price £20.—Parker, Printer, St. Ives, Hunts.

4 h.p. Roc. Druid forks, two-speed, ball bearing engine, Bosch magneto, Dunlops, complete for road, new at Easter; owner getting car; £41.—Riddelsdell, Hadleigh, Suffolk.

2 1/2 h.p. Featherweight Rex, 1898 model, magneto, nearly new, not ridden 300 miles, new condition, no fault, spare belt, tools, horn, pump, lamp; cost 25 guineas, take £15.—Cox, Eversley, Hunstanton.

TO Sidecarists.—Vindec twin, bought late 1907, but practically 1908 machine, has the 1908 improvements, Vindec two-speed gear, low frame, 1908 B. and B. carburetter, 1908 double silencers, tank enamelled cream, barely scratched, Rich's tube (unpunctured); cost without extras £63, cash complete £45; would exchange, cash balance, 8 h.p. Rover, Dion, or Riley car.—Letters only, Cecil Turner, Queen's College, Cambridge. Cycle garaged in London.

Everything on approval

Recognising the difficulty our provincial friends have in selecting goods from lists and advertisements, we have now arranged to supply all standard goods on approval when desired. Approval orders must be so marked and accompanied by remittance for the full amount. Our stock is a very large and varied one. Send for list. All requirements are catered for.

MOTOR CYCLES, TRICARS, AND SIDECARS.
Are you interested in new or second-hand machines? We carry a good selection, and our exchange and extended payment system applies.

PHELO AND MOORE, magneto, two speeds, 3½ h.p. Reliability proved. Gold medals 1905-6-7 and 1908.

DERMATINE BELTS
HOLD ALL RECORDS.

End-to-End Record, June 9th and 10th:

Mr. A. W. Bentley, using Dermatine belt.
M.C.C. 24 Hours' Ride to Edinburgh, June 5th and 6th:

35 were successful, using Dermatine belts.
Stadium Race Meeting, June 8th:
Harry Martin, First in Ten Miles Race.

Stadium Race Meeting, June 24th:
Again the First, Second, and Third winners were fitted with Dermatine belts.

No other belt holds such records. The Original Rubber and Canvas Belt. **BEWARE OF IMITATIONS.** The standard belt that is adopted by all leading manufacturers.

End-to-End Record.

Read the testimonial from the Triumph Co.
Coventry, June 22nd, 1908.

Mr. Stanley Webb, 32, London Road, Bromley, Kent.

Dear Sir,—I do not know whether we have written to you about the Bentley End-to-End record. Mr. Bentley had a Stanley Dermatine Belt fitted to his motor cycle. It gave him entire satisfaction, and had not to be touched once during the whole ride of 886 miles.

Yours faithfully, M. J. SCHULTE,
Manager Director, Triumph Motor Co., Ltd.

Second season in use, and still going strong, 125, Bunhill Row, E.C., 12/6/08.

Dear Sir,—You will be pleased to hear that the "Dermatine" Belt I used in this year's London-Edinburgh run gave me no trouble whatever, and that, moreover, it was the identical belt I used in last year's L.-E. run. It is still going strong, though having run nearly 3,000 miles. Yours faithfully, J. P. LE GRAND.

800 miles, and no trouble nor once shortened.

Southernhay, Loughton, June 12th, 1908.

Dear Sir,—I must again congratulate you upon your excellent belts, as the one I used on my 3½ Vindec in the Schulte Cup Competition to Edinboro' and back gave me no trouble whatever, and was not even shortened once in 800 miles. I consider this a severe test, and a splendid proof of efficiency.

Yours faithfully, OWEN L. SUMMERS.
Hundreds of Testimonials. British Made.

CARS FOR SALE.

p. De Dion Populaire, genuine licensed car; £65; two-seater.—Below.

20 h.p. Winton, side entrance, four-cylinder, vertical engine, magneto, car; £100.—Below.

16 h.p. Forman, tonneau, four-cylinder, direct drive, three speeds, reverse; —Below.

30 h.p. Hurst, side entrance, four-cylinder, hood, screen, three speeds, car; £125.—Below.

50 h.p. De Dietrich, 1905 tonneau, four-cylinder, dual ignition, magnificent running car; £185.—Below.

28 h.p. Gladiator, side entrance, 1906, four-cylinder Aster engines, folding top; worth £250, accept £165.—Below.

ULR 6ft. Screw-cutting and Surfacing Lathe, complete, in every way, 6in. res; £14 10s.—L. N. Palmer, 190, Mellison Rd., Tooting.

p. De Dion-Progress Car, with hood and screen; £35, or near offer.—Read, Sheer.

ERRACQ Runabout, three speeds, good order; price £25; exchange larger car. Llanfyllin.

NNIS, 8 h.p. De Dion engine, seats two or four, perfect; £50, offer.—6, Shrub Road, Streatham.

UMBER, 8 h.p.; any trial; £40, or exchange Triumph and cash.—7, Broad St., Stratford-on-Avon.

p. Wolseley, three speeds and reverse, back tyres new, non-skid, just overhauled; £55.—10, High Road, Chiswick.

p. Light Car, practically new, two bucket seats; bargain, £25; exchange considered.—98, Potternewton Lane, Leeds.

ANDSOME Little Two-seated Car, as new; trial by appointment; £30, or tricar cash.—Andrews, engineer, Spalding.

p. Rover Car, two-seater; trial to intending purchaser.—Address, A. Cross Parkside Road, Bradford, Yorks.

EARANCE.—Rochet three-seated 5 h.p. car, fast, climb anything, good running; £20; photo.—Stanburys, Liverpool.

h.p. Touring Car, four cylinders, fast and reliable; £75; accept tricar or in part.—20, Brunswick Square, S.E.

h.p. Two-seated De Dion, two speeds, good tyres, new lamps, outfit, complete; £30.—Singlehurst, Oliver Street, Northampton.

EARANCE.—8 h.p. De Dion engined two-seater car, new covers, glass screen, doors, nice condition; £25.—Stanburys, Liverpool.

ADIATOR, 12 h.p. Aster engines, three speeds and reverse, four seats, everything in splendid condition; £75.—Stanburys, Liverpool.

p. Beaufort, four-seater, three speeds, reverse, Cape hood; £39 10s.; tricar or in bike part payment.—Farrar, Square 1, Halifax.

12 h.p. Twin-cylinder Pick Car, three speeds and reverse, chain drive, tonneau body, equal artillery wheels, fine condition; £45; and

12 h.p. Richard-Brasier, two-cylinder, tonneau body, detachable; £75; two-seater accepted as part.—B., 132, Tressillian Rd., Brockley, S.E.

9 h.p. Singer, not run 50 miles, cost over £150, guaranteed perfect, double seat; cash £77.—Hollins, Halsey St., Red Lion Square, W.C.

h.p. Darracq, three speeds, reverse, artillery wheels, hollow dash, etc.; offers, or exchange motor cycle or tricar.—The Motor Cycle Office, Coventry.

h.p. Oldsmobile, in splendid condition, with hood, lamps, spare tyre, seats; £30, or near offer; room wanted for other car.—Lawson, Rurley Mount, Leeds.

ERRACQ, 20 h.p., four-cylinder, thoroughly overhauled, and new 105 rear wheels and tubes, all spares, including four front and three tubes, guaranteed to do 50 miles per hour; £120 cash, or exchange; run willingly, or will hire out.—De's, Powell Street, Halifax.

CARS FOR SALE.

15 h.p. Duryea Car, side entrance, tonneau, nearly new; list price £500, great bargain, £95, near offer; part exchange.—98, Potternewton Lane, Leeds.

6 1/2 h.p. Humberette, three-speed and reverse, good condition and running order, splendid hill-climber, quantity of spares; £45.—Taylor, Montagu House, Kettering.

7 h.p. Imperial Two-seater Car, three speeds and reverse, artillery wheels, sloping back, all in perfect order; £25, or exchange.—Stevens, 4, Goldhawk Mews, Shepherd's Bush.

SINGER Governess Car, seats three, excellent condition, perfect running order, magneto, splendid hill-climber; £20, or offer.—E. A. Turner, Burlington Road, New Malden.

5 1/2 h.p. Humber Car, splendid condition, two speeds and reverse, new tyres, pair brass lamps, tools, and spares; £38, a real bargain.—Ernest Clay, Leicester Road, Nuneaton.

6 h.p. Humberette, two-seater, Dunlop tyres, fitted with Cape hood, lamps, etc., in good condition, and fine running order; 33 guineas.—82, Queen's Road, Peckham, London.

M.C.C., 8 h.p., four-seater, in splendid running order, three speeds and reverse, not a cut on tyres, grooved Dunlops; £45; trial any time.—E., 32, Crowhurst Road, Brixton.

REGAL, 6 1/2 h.p., Aster engine, tonneau body, to seat four, three speeds forward and reverse, leather to metal clutch, in good condition; trial; £55.—Louis Davis and Son, Moseley, Birmingham.

6 h.p. Peugeot, three speeds, reverse, heavy Dunlops, artillery wheels, non-skids on back, all spares, three lamps, practically new; £60; good motor cycle part; photo.—Beighton, 27, Queen's Road, Aston.

6 h.p. De Dion Engined Car, three speeds and reverse, in splendid condition throughout, fast and very good hill-climber; £75, or motor cycle and cash.—Stanton, 86, Colvestone Crescent, Dalston, London.

THE Simplest, most reliable, and best two-seater car on the market is the famous little Laurin and Klement, 6-7 h.p. and 8-9 h.p., from £150, including magneto, two cylinders, thermo-syphon cooling, etc.—Next.

THESE Little Cars are absolutely reliable, very fast, and will pass on hills cars of greater power and cost; lower cost of upkeep than any other car of same power.—Next.

STANTON Supplies these cars. Come and see one, have a trial run, and buy one. Motor cycles and triars taken in part payment; write for particulars.—Stanton, 86, Colvestone Crescent, Dalston, London.

10-12 h.p. Speedwell, two cylinders, four-seater, three speeds and reverse, Clincher tyres, painted green, and upholstered red, latest type, in grand running order; 85 guineas.—84, Queen's Road, Peckham, London.

SELL either (not both) smart two-seater, 6 h.p. De Dion Bouton, thorough order, and reliable, two speeds and reverse, £45, or Sunbeam-Mabley, nearly new condition, £25, cash, no offers.—Chemist, 187, St. Ann's Road, South Tottenham. Phone, 1790, Tott.

SIMMS Tonneau Car, about 8 h.p., tonneau, four-seater, equal artillery wheels, three speeds and reverse, very good condition, and perfect running order; £35; want good open frame tricar, or twin and sidecar; cash either way.—128, High Road, Tottenham.

BEESTON Humberette, thoroughly overhauled and re-varnished, two brand new tyres on back, front very good, two spare covers, side doors; any trial; bargain, 40 guineas, or exchange two-speed tricar and cash.—Frank Swindall, 18, Newland, Northampton.

DE DION, 6 h.p. engine, in Turner chassis, two-seated body, fitted with hood and screen, Stepney spare wheel, cover and tube, new tyres on all wheels, in guaranteed condition, reliable, and good hill-climber; any trial; £60.—Louis Davis and Son, Moseley, Birmingham.

CARS FOR SALE.

8 h.p. Alldays, seat four, three speeds and reverse, cardan drive, artillery wheels, splendid chance for one who wants a smart reliable car, guaranteed in every way, ready to drive away; price £70.—Mr. Rayment, Central Park Road, High Street South, East Ham.

10-12 h.p. Two-seated Vauxhall, three cylinders, three speeds and reverse, bucket seats, equal artillery wheels, magnificent condition throughout, very fast, climb anything, the prettiest two-seated on the road, has had very little use; sacrifice £65, or offers; take tricar part payment.—R. Else, Leawood, near Matlock.

ROVER Cars.—The 6 h.p. single-cylinder two-seated Rover is the best low-priced car on the market. It is fast, silent, exceptionally reliable, and far more comfortable to ride and drive than tricars or motor cycles. We will take these in part exchange, or supply on deferred payments. — Louis Davis and Son, Moseley, Birmingham.

EXCEPTIONAL Bargain.—I will sell my lovely 6½ h.p. gold medal Wolseley two-seated car, done very little running, tulipe body, beautifully upholstered in leather, artillery wheels, equal, the engine, gears, tyres, and everything perfect order, guaranteed, three speeds and reverse, wonderful climber; inspection invited; sacrifice for £65 immediate sale, cash wanted.—1,046, London Road, Derby.

HOTELS AND APARTMENTS.

WHEN Visiting London stay at Waverley Temperance Hotel, 17, Euston Square. Bed, breakfast, attendance from 3s.

INSURANCE.

PLEASE Send for full covering Motor Cycle Policy, from 19s. per annum.—Bass, Insurance Broker, Ongar.

INSURANCE Policies of every description for motor cycles are issued by Hugh J. Boswell, insurance broker, Norwich, at exceptionally low rates; fire or self ignition, 2s. 6d.; third party, 7s. 6d.; accident to cycle, 15s.—Write for full particulars.

BUSINESSES FOR SALE.

£180 will purchase old-established universally known motor business, Liverpool, central, including four cars and parts, worth £300, auction prices; owner retiring.—Particulars, Stanburys, Liverpool.

ACCUMULATORS.

The End-to-end Trial.

The Machines.

LAST week we reported in detail what has been acknowledged by everybody to have been the most severe test to which motor cycles have ever been put. It is true that a contest was run over the same route in 1906, but the weather encountered was exceptionally fine, and consequently the conditions were most favourable. This year, however, not a day passed without a shower of rain, and on the Thursday and Friday the weather was unusually bad, even for the Highlands. Those who have never competed in a six days' trial may look upon the End-to-end run as easy, but let them try and complete the journey and they will find things very different. The Grampian Road presents few difficulties on a dry day, but let it rain and blow as it did on that memorable Friday, and the conditions are entirely altered. The unfortunate competitors went through an experience they will never forget, and not one will admit that he had an easy time. Two points in this competition have especially impressed us. Firstly, the enormous improvement in the performances of the machines compared with those which traversed the same route two years ago. Then Red Hill and Shap were real terrors. This year they were as nothing to the majority, and on the occasion of the latter climb we only felt justified in referring to the best performances.

On Berriedale, on the contrary, the improvement was not so marked, as the number of riders who dismounted was far too great. This was mostly due to the absence of change speed gears on the majority of the machines, which in all cases where fitted, rendered the ascent simple, easy, absolutely safe, and practically

certain. With the single geared machines the skill of the rider was the more important factor, and in these trials the personal element should be eliminated as far as possible. Dommett's performance was a remarkably good one, considering his machine was single-gear and he had never seen Berriedale before. In our opinion he thoroughly earned the prize. Dr. Mayo's effort was exceedingly neat, and the skilful manner in which the gear was changed, and the easy way in which the ascent was made excited universal admiration.

The very excellent performances of nearly every motor bicycle entered show that now machines are so vastly better than they were two years ago the gold medals are too easily won. Another time it is quite possible that gold medals will only be awarded to those riders who lose no marks at all.

The lightweights, with two exceptions, have unfortunately not shown up very well, as there have been too many structural breakages. The lightweight as we know it now is a comparatively new type of machine, and experience has to be gained by the makers as to how little they may allow a machine to weigh without impairing its strength. People seem to think that these small machines are unfit for long distance touring and hard work, and this is in a sense true, but, unless they can prove themselves to be equal in reliability to the more powerful models (though, of course, inferior in speed), they will have a hard fight to maintain their existence. The makers of the lightweights will profit largely by these trials, and though matters have been unfortunate for them, they have undoubtedly learnt lessons of inestimable value, bought at a high price, it is true, but of great benefit ultimately. One regrettable feature of the contest was the absence of passenger-carrying motor cycles. The sidecar in various forms has met with great popularity lately, and it remains to

prove the absolute reliability of the combination in a carefully observed trial, and it must not be forgotten that no motor bicycle and sidecar has ever been through an A.C.U. trial without losing marks. Despite these apparent drawbacks they are most comfortable, and are preferred by many to a tricar.

The Riders.

Having dealt with the machines, we will now devote our attention to the riders. Never before in any long distance trial have such wonderful pluck, endurance, and skill been seen. If the motor cycling public ought to be grateful to the A.C.U. for helping to develop improvements in motor bicycles, how much more ought the British public as a whole to be grateful to that body for bringing out that splendid doggedness which is inherent to those of our nation? We cannot but admire the perseverance shown by Miss Hind, Mayo, Craig, Nelson, Gwynne, and Fletcher, who, when all seemed to be lost, struggled bravely on, and, after spending days, and even in some cases nights, of hard work to attain the goal, were rewarded at last

with the sight of John-o'-Groat's House and the beautiful Orkneys in the distance. The cases of two amateur riders are interesting. H. D. Seale, who had not ridden a motor bicycle for a year, entered for the End-to-end, and tried to get a machine. Failing to get delivery after trying two different sources, he arrived at Penzance with clothing, spares, and everything save the one important factor, a mount. Happening to find a $3\frac{1}{2}$ h.p. Triumph which had been some weeks in stock in a shop in Penzance, he bought it on the spot, and brought it through the competition without losing a mark. Dr. Adams, another Triumph rider, had but one hundred miles' experience, and he was quite as successful as Mr. Seale. Nelson, who had spent forty-eight hours on the road at a stretch, and who arrived at John-o'-Groat's when everyone was leaving, spent a happy day motor cycling on the 19th inst. in company with many others who had not had enough of their favourite pastime. Despite its severity, the 1908 End-to-end run has been even more successful than its predecessor in 1906, and we sincerely hope it will not be the last that will be held.

AUTO CYCLE UNION END-TO-END TRIALS. MACHINE ANALYSIS.

The following analysis of the competing machines in the End-to-end serves to prove once again the absolute reliability of present day motor cycles:

Twenty Triumphs out of twenty finished; all gained gold medals except one, which secured a bronze medal. Eight Rex out of eight finished; five gained gold medals, one a silver medal, and two bronze medals. Five Vindec Specials out of five finished; three gained gold medals and two silver medals. Two N.S.U.'s out of two gained gold medals, likewise two Phelon and Hoopes, and two Matchless machines. Two F.N.'s out of two finished; one gold and one bronze medal.

Nine out of twelve bicycles fitted with change speed gears duly finished the run, but in only one case was the withdrawal due to the gear.

Two lightweights survived the ordeal—a $1\frac{1}{4}$ h.p. Motosacoche, which gained a silver medal, and a Moto-Rêve, which was awarded a bronze medal.

Three chain-driven and two gear-driven bicycles finished; the remainder were belt driven.

Thirty-three single-cylinder, thirteen two-cylinder, and two four-cylinder motor cycles comprised the successful mounts; forty-three of them had Bosch and two Eisemann magnetos.

END-TO-END IMPRESSIONS.

By B. H. DAVIES.

THE vagaries of rim, tyre, and motor makers unfortunately prevented me from competing in this year's trials—a disappointment that was the more sickening because my machine was one of the most substantial and reliable twins I ever straddled. And after Mr. Straight found me a job as an official and Mr. G. H. Levick kindly found me

The only lady competitor in the End-to-end Trials making light work of Shap. Miss Hind on her Twin Rex.

a seat on his six-cylinder Napier, domestic reasons compelled me to leave the trials at Carlisle. But in the 470 miles for which I was able to accompany the riders I was able to perceive several striking and gratifying contrasts between the two End-to-end trials.

The Two End-to-end Runs Compared.

The first and most pronounced contrast lay in hill-climbing. Practically every machine from the $1\frac{1}{4}$ h.p. "Motor Sausage" to the biggest twins climbed every hill without effort or faltering. I saw all the machines on Redhill and on Shap, and there was a definite impression of comfortable mastery about the manner in which engines, large or small, riders heavy and light, faced and conquered these stiff ascents. The most illuminating climbing, however,

that I witnessed was on the twisty climb up out of Bodmin. All the lower corners were excessively greasy, and the riders were compelled to slow down to an absolute crawl. The flexible engines nevertheless grappled with the gradient, though each separate explosion was distinctly audible, and in particular I saw a single cylinder Rex, a Triumph, and a twin-cylinder Moto-Rêve take this tricky and dangerous climb slowly, surely, and confidently. Heretofore slow climbing has been the exclusive property of the two-speeder. To-day it is well within the range of a high-class single geared one cylinder machine.

The second emphatic contrast observed was in the safety and speed of steering over grease. At one point of the run the big Napier had to be held back for several miles of greasy lanes behind a large clump of competitors. The road being slimy, narrow, and highly cambered, our courteous driver did not like to force the motor cyclists off the crown of the road, so that he might pass them. The grease was real grease, and yet as the quiet six-cylinder purred along at the tail of the string its speedometer registered a steady twenty-five to twenty-eight miles an hour. This improvement in the comfort with which a motor bicycle can be driven over treacherous surfaces I unhesitatingly ascribe to—

- (1) Better distribution of weight.
- (2) Lighter weight of the machine.
- (3) Increased engine flexibility and smoothness.
- (4) Rubber studded tyres.

Martin Geiger (6 h.p. N.S.U.) climbing Shap at full speed.

End-to-end Impressions.—

The third contrast lay in the huge reduction of minor troubles. This is evinced not only by the fact that every single starter reached the end of the first day's ride, but by the absolutely clean sheets most competitors scored in every day's run. Two years ago broken valves, broken valve lifters, choked jets, punctures, ruined sparking plugs, etc., were in daily evidence. The road was littered and strewn with feverish tinkers. This year up to the point I left the route I did not hear of a broken valve, a choked jet, or a changed plug. A few punctures were the worst that befell the men who were really competent riders on standard machines of known makes.

Full Power Maintained.

The fourth contrast is one of special interest to amateur riders, and consisted of the *maintenance of power*. Two years ago that precious hour of adjustments each day from 7 a.m. to 8 a.m. was spent in feverish effort to restore to the engine lost pace and

The fifth contrast lay in the promptness with which every machine started. There was not a solitary motor cycle in the trial which did not start promptly and speedily on every occasion, and I saw several machines, notably some of the Triumphs and the two four-cylinder F.N.'s, restarted quite comfortably on very severe gradients, and pick up as well as a 1906 machine would have done on the flat. Very few riders needed to inject anything, even when their engines were stone cold. In this connection I must add a word in admiration of the great efficiency of the modern four-cylinder. Valve, distributor, lubrication, and carburation difficulties with this type of machine seem to have been completely conquered in the F.N. They rolled smoothly and steadily over grease, they ripped up all the hills at a great speed, they started in a yard or two anywhere, and no machines entered ran more reliably.

The sixth contrast lay in the presence of 70 lbs., 80 lbs., and 90 lbs. machines, lying well up with the leaders all day long, and climbing long hills, often

On the last day of the End-to-end trial, the performances of the competitors on Berriedale Hill were carefully noted. In this illustration, C. A. Palmer (twin Roe) is seen rounding the first sharp bend near the foot of the hill.

climbing powers. Valves were ground in, new springs fitted, carburetters reset, and ignition tuned up. This year, going in and out among the busy preparations, I moved in an atmosphere of calm and confidence. The men knew their machines were right for the day's run. I did not see valve grinding, ignition timing, or carburetter adjustments in progress. A few were mending tyres. The great majority were coolly and comfortably taking precautionary measures. One would be running a broach through his jet, another inspecting his contacts, and perchance giving them a wash of petrol, a third testing the tightness of his valve caps and plug washers with a wrench. But there was a delightful absence of that anxiety and flurry which has marked that often feverish hour in previous trials.

without any pedal assistance at all, and seldom with more than a little light work at their high-gear pedalling gear. One of the Motosacoche, both the Moto-Rêves, and, previous to their accidents, all three Douglas machines, positively covered themselves with glory, and they smashed for ever the calumny that has represented them as fair-weather or flat-country machines. Neither wind, weather, nor gradients were serious obstacles to any of them, and in two respects their achievement was a regular eye-opener to myself, personally, viz., the high average (exceeding legal limit) that they were able to maintain and the ease with which they romped up hill following hill in quick succession.

The last contrast was the number of variably-gear machines entered. There were only four in 1906, and

End-to-end Impressions.—

this year no less than a dozen, but, owing to the vast improvement in the engines and a full supply of good oils, there was not the same call for second gears. Other things being equal, however, the man with two speeds has the most comfortable time. Easily as the single-gear machines of to-day start, prolonged experience with two-speeders makes me resent the admittedly slight exertion of pushing off even a one-speeded $3\frac{1}{2}$ h.p. I have grown used to paddling off with my feet while seated in the saddle, and I loathe anything else. Several competitors utilised this admirable method. Referring to individual gears, Mr. Powell on the B.P. used his low gear a good deal. He had a small engine—somewhat out of tune, too, I imagine—and I doubt if he would have got far without his emergency gear. As it was, he had a comfortable ride as far as I watched him. The two Phelon-Moores went great guns. Mr. Moore's machine was in splendid tune, and I never saw him use his low gear except when starting. Mr. Milnes used his on several hills.

of a grain of mechanical instinct. Others had extraordinarily bad luck. I will take Mr. Dixon on the $3\frac{1}{2}$ h.p. two-speeded Vindec as an illustration. He had an excellent machine, and as he did the double journey to Edinburgh and back on it in the Schulte Cup it is evident he knows what he is doing. Well, to begin with, he used four gallons of petrol in the first seventy miles, whereas other amateurs on the bigger Vindec's were doing one hundred miles per gallon. Examining his machine, he found that there was no leakage at the carburetter unless the engine was running. When the engine ran there was no leakage, strictly speaking; but a perfect fountain of petrol began to spray out through the air holes of the jet chamber as soon as he got on the road, producing excessive consumption and gross overheating. He had a good kit of spare parts, and he tried weak and strong a.o.i.v. springs, new valves, big and little valve opening, all to no purpose. At Launceston some of us noticed the huge diameter of the F.N. valve, and advised him to still further reduce the lift and strengthen the spring,

A.C.U. END-TO-END RELIABILITY TRIALS.
Capt. Sir R. K. Arbuthnot, Bart., R.N., cleaning his Triumph in the hotel yard at Tain, ready for the last day's run.

F. W. Barnes ($3\frac{1}{2}$ h.p. Zenette with Gradua gear) at Pitlochry, the finish of the fourth day's run.

I do not know at the moment of writing whether Mr. Dixon on the $3\frac{1}{2}$ h.p. Vindec got to John-o'-Groat's at all, but without a two-speed gear he would never have reached Warrington, owing to an exasperating and elusive trouble referred to below. The Zenette gear is splendid. The engine runs at normal speed without variation in speed from the foot of the steepest hill to its summit, and it is all accomplished by gently revolving a neat little hand wheel conveniently placed. Mr. Carty's N.S.U. gear came in handy once or twice. The other gears I did not see in operation at all, except for one, which went up Shap so extraordinarily slowly that the rider could scarcely balance his machine at all.

Some of the riders who failed were personally unequal to performing even a leisurely tour of 900 miles efficiently. They did not know how to keep in tune or how to drive the best motor cycle ever made. A small percentage of riders are always like that, and always will be, lacking in commonsense, and devoid

promising him that two or three of us who fancied we knew something about motor cycles would have a full theoretical solution cut and dried, waiting for him at Exeter if he could get there by tea time. Mr. Dixon struggled on as far as Warrington—I hope he got through, but I do not know at the moment—and none of us, from Wells downwards, could help him to a solution without personally trying his machine, which, of course, the regulations forbade. A rare and elusive trouble of this sort may attack even a first-class rider on an important occasion, and put him out of the running. Mr. Dixon simply tore up some of the hills, apparently as the result of pre-ignition. Then perhaps on the very next hill the engine would peter away to nothing on the low gear.

Motor Cycle Tyres.

Tyres, though much maligned nowadays, caused far less trouble than in 1906. I particularly noticed what a good thickness of tread the Continental modèle de

End-to-end Impressions.—

course possesses. Few fitted it, as it has a smooth exterior. Mr. Reinberg told me the Continental people are bringing out the same tyre with a non-skid basket-pattern tread, and then riders who don't mind a slow tyre provided only it will wear well and neither puncture nor skid will recognise their long sought ideal.

Referring to the conduct of the trial, I only saw two causes for dissatisfaction, and one is difficult to remedy. As in previous trials, there was always a great scrimmage for petrol in the controls, due to the fact that though fifty cans of spirit were on the premises there was only one measure and one funnel for sixty men to fill up with. This is tiresome when a rider has half an hour to spare, but it is sheer exasperation if a puncture or other delay has made every moment precious. The A.C.U. ought to provide funnels, carried on the leading official car, or else urge its garage men to provide six plain tin ones at a cost of 1s. 6d., with some squares of muslin to filter the spirit through. I suffered so much delay in 1906 from this cause that I then made it a practice always to fill up outside control when possible—a sacrifice of time which might prove perilous if one's luck was out, and this year I took both oil and petrol funnels down to Land's End in my kit. But this is a point the officials should guard against.

Running to Minimum Time.

The other general complaint requires more solution. In these trials a knot of riders drive fast to a point outside the next control, wait till "minimum time" is up, and then go in to get their cards signed. This year—for the first time—practically the whole of the entry reached every single control by "minimum time." As a result the unlucky control man—unused to his job,

a stranger to all the men, and, perhaps, exalted by a moment's brief authority—would be inundated by fifty excited, hurried, and often unreasonable riders. A little impatience on one side and a lack of businesslike method on the other led to men being delayed as long as twenty minutes at some controls, and leaving considerably ruffled in their tempers. This should be improved before another trial is run with so large an entry. No doubt the checking system could be simplified, or an extra checker secured for each station, and two separate tables employed. But the obvious method is to string the riders out by starting them in half dozens at five minutes intervals, under which system no checker would be hustled and insulted nor any hurried rider suffer aggravating delays. The same applies to the Edinburgh run as well.

Non-competing riders will be interested to hear that marks were saved on tyre troubles, as against 1906, by the universal use of detachable tubes, and by the slightly less extended employment of Miraculum. Butt-ended tubes seem to have lost favour. I personally pin my faith to the Rich and to a comparatively unknown make, the Smith, which is absolutely satisfactory in wear. At Land's End many competitors were seen injecting Miraculum, and it successfully sealed many a puncture during the trial. The collapsable tube screws on to the valve after the plunger has been removed, and the tube is then folded up from the bottom, pressing all the Miraculum into the tyre. This process takes about twenty minutes. The compound is then distributed all round the tube by kneading with the hands, the valve seat cleansed, and the plunger replaced. In the event of a gash, it does not make patching difficult, as previous "sealing" solutions have been known to.

VICTORIAN M.C.C. 100 MILES CHAMPIONSHIP.

THE above club's annual 100 miles road championship was decided on Monday, June 8th, in fine weather. The course, which was along the main road to Sydney, starting from Campbellfield, ten miles from Melbourne, to a point twenty-five miles out, included three stiff hills, and had to be covered twice. There was a strong north wind which severely tested the capabilities of the various machines. Twenty-two riders faced the starter.

The first twenty-five miles found out the weak spots in many of the machines, broken plugs and puncture being fairly numerous. Flocks of sheep on the road considerably hindered the competitors. Fastest time on the first fifty miles was made by Fraser, his time being 1h. 21m. Benn coming next in 1h. 23m., and Jen-

W. H. Stevens, who covered 100 miles in 2 hrs. 53 mins. on a 1908 Triumph.

kins 1h. 24m. Stevens, the ultimate winner, punctured in the first round and lost over ten minutes. At seventy-five miles Penn and Cuddon reached the turn together, with Stevens three miles behind; then came Fraser, Scarcebrook, Kidgell, and Perry. At Wallan, Cuddon's back tyre burst, and six miles from the finish Stevens overtook Benn, who had met with an accident on Malpas Hill, and finished in 2h. 53m., ten minutes ahead of Benn.

The first riders to finish were:

1. W. H. Stevens (25m. start), 2h. 53m.
2. L. Benn (25m. start), 3h. 3m.
3. L. Kidgell (10m. start), 2h. 49m.
4. H. Perry (14m. start), 2h. 53½.

L. Benn afterwards stating he had accepted outside assistance to reach home, the second and third prize were awarded to Messrs. Kidgell and Perry.

In addition to the first prize of £12 12s., Stevens who rode a 1908 Triumph, gained the trophy for fastest time for 3½ h.p. machines (£3 3s.), W. H. Cuddon (Peugeot) fastest 2¾ h.p. (£2 2s.), and L. Kidgell (Peugeot) fastest 5 h.p. (£5 5s.). The novice's prize was won by D. Fraser.

We are informed by the makers of the Ruthardt magneto that C. A. Vandervell and Co., Warple Way, Acton Vale, W., will handle the new Ruthardt magnet for motor cycles, which was described in *The Motor Cycle* of July 15th.

Questions & Replies.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, must be accompanied with a stamped addressed envelope for reply.

Burnt Gases and Altering Gear.

? I am riding a 1904 3½ h.p. Rex, and at night I notice that flames issue from the silencer. I should like to know the cause of it. I am thinking of altering the gear. It is at present 6 to 1, but on level roads the engine gets very hot. I weigh nine stones. Could you tell me what size pulley I should want to give a higher gear? The present one measures 4½ in. outside, with 28 in. wheels.—E.E.L.

The symptoms you refer to are caused by there being no exhaust pipe in this type of machine. If you had a long exhaust pipe and silencer the flames would not appear. We should not advise you to have a larger engine pulley than 4¾ in. diameter.

Low-built Machines, Exhaust Valves, and Inner Tube Filling.

? A friend of mine wishes to go in for motor cycling, and has had a spin or two on mine. He is all right when in the saddle, but being very short in the leg cannot straddle the machine for mounting and dismounting. (1.) Can you tell me what makes of motor cycles have exceptionally low saddles? (2.) On my own machine—a 1906 Rex—the exhaust valve pits, burns, or breaks very frequently, and requires skimming up after 100 miles. Machine otherwise runs well. Can you suggest the cause of the trouble? Silencer clear. (3.) In ordering a new machine should detachable tubes be specified, and if so which variety—(a) butt-ended or (b) through circulation? (4.) What are the virtues of Miraculum, and what its disadvantages? Would it be any use in an old semi-porous and patched inner tube, and do you recommend its use in new tubes?—REX, Leamington.

(1.) Most up-to-date machines are very low built, and it is easily possible to touch the ground when seated in the saddle. If your friend cannot, he could have 24 in. wheels. (2.) Probably you drive on too strong a mixture, or with throttle too far open. You might try a special nickel valve. (3.) Butt-ended tubes would be desirable; those with through circulation are most popular. (4.) We have had no experience with the material in question, which is claimed to cure entirely any tube which has become porous.

Machine Requires Tuning-up.

? I have an Excelsior cycle fitted with 3 h.p. Fafnir engine and Longuemare carburetter. Everything seems to be all right at home while on the stand, but after I have ridden it about two miles it gets sluggish and stops altogether. The accumulator is in good order, wiring seems to be right, carburetter is clean, and compression is very good. Kindly tell me how to locate the faults and how to remedy them. Do you think above machine would, if put in good order, be powerful enough to take a sidecar, total weight of rider and passenger nineteen stones? Large pulley revolves once to 5¾ times of the small pulley.—W.M.

Probably the engine wants taking down and clearing of all carbon deposit. You do not state if it overheats at all. See that the carburetter and petrol pipe are quite clear, and test the accumulator with a voltmeter. There is probably very little the matter with the machine; the engine is a good one, and if you get it overhauled by a good man it would be quite capable of taking a sidecar on level roads. The gear for this purpose would be about right, but a two-speed gear would be advisable.

Re-enamelling and Re-plating.

? I have just purchased second-hand an Advance motor cycle. I want to get it re-plated and re-enamelled. Where is the best place to get this done, and what is it likely to cost? The engine has just been overhauled, so that ought to need no attention. There is no accumulator. What size do you recommend? What brand of petrol and lubricating oil suits this make of machine? There is no stand. Ought I to get one fitted? Should I get the re-plating and these alterations done at one place, and have an estimate for the whole?—S.N., Beds.

Enamelling and plating are done at various places. Try the Coventry Plating Co., or Sills and Co., Coventry. It will make a lot of difference if you take motor cycle to pieces yourself and send the parts. Size of accumulator should be ordered to fit tank. Any brand of petrol, such as Shell, Pratt's, etc. Lubricating oil—any good motor cycle brand for air-cooled engines, but see that you purchase it in a sealed tin. A good local man would attend to all your requirements and give you an estimate for the whole of the alterations.

ARE MOTOR BICYCLES RELIABLE? YES!

A record was created by a score of riders of 3½ h.p. Triumph motor bicycles during the End-to-end run. The top photograph shows the riders at Land's End at the start of the 893 miles run, and the bottom photograph all competitors to a man at John-o'-Groat's six days later. Sixteen were private owners. The trade riders are seated on the grass in the lower illustration.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Front Wheel Stands.

[3444.]—To support the front wheel I have fixed to the down tube a stout clip, which carries a lug $\frac{1}{2}$ in. diameter and $1\frac{1}{2}$ in. long projecting vertically downwards. Alongside the front fork is carried a piece of steel tubing large enough in diameter to slip over the lug, and long enough when in place to keep the front wheel off the ground. The arrangement works all right, but might be neater. S. F. W.

The Folly of it.

[3445.]—Regarding letter 3412, I can gather from "F. G. S.'s" ignorant abuse of your most interesting and instructive paper that he is one of those persons who has sat on the saddle of a motor bicycle, sounded the horn, and aimlessly moved the levers, the machine being on the stand, of course. After this he thinks he has sufficient knowledge to advertise his lack of reasoning power in print. P. F.

Leaking Batteries.

[3446.]—Referring to Mr. R. N. Morley's letter in your issue of July 8th respecting leaking batteries, we would like to mention that in our accumulators the rubber plugs are hermetically sealed by a special contrivance, and any movement made absolutely impossible. At the same time, this device quite prevents any creeping and corrosion around the terminal. We agree with Mr. Morley that the point is an important one, and we discovered a long time back, from actual riding experience, that some sort of arrangement such as we fit was essential. W. AND R. JACOBS.

Leeds to London and Back Run.

[3447.]—Having had valuable assistance rendered by Mr. Bunting and Mr. Wilson on the occasion of our recent run, and unfortunately having mislaid their address, I wish to use your columns for the purpose of thanking these gentlemen for their sportsmanlike attitude in helping me in checking the Leeds, Bradford, Manchester, and Middlesbrough Club teams at Barnet and Highgate during the early hours of Sunday morning. I feel sure that my club (the Leeds Motor Cycle Club) will make the two riders named very welcome should they visit our city. JAMES R. KELLY,
Hon. treasurer Leeds M.C.C.

Standardisation of Tyre Rims.

[3448.]—The Hanover Rubber Co. request me in justice to them to write you a further letter about the tyres they supplied to me for the End-to-end run to be used on a 6 h.p. twin. When they sent the covers to the makers of my machine they expressed some doubt as to whether the rear wheel cover would fit its rim, and earnestly requested the makers to test the fit, saying they could immediately supply another cover to fit if the original one was a misfit. Needless to say, I had also given instructions for the fit to be tested before the covers were sent to await me at Penzance while I rode down on old tyres. Unfortunately, the makers of the machine omitted this precaution, being exceedingly pressed with orders and business—an omission they regret no less bitterly than myself. However, the fact that the Hanover Rubber Co. requested us to take this precaution transfers all shadow of blame from their shoulders.

It does not, however, affect the point of my previous letters. I found myself in the garage at Penzance with a 650 x 65 mm. rim and two 650 x 65 mm. covers of different makes. One of these covers was so tight a fit that to remove it single-handed was a tremendous exertion. The other was so slack a fit that any number of security bolts could not have kept it on the rim. B. H. DAVIES.

The Fit of Piston Rings.

[3449.]—Being a constant reader of your invaluable paper, I invariably peruse the Comments of "Ixion," which I must say are very interesting. I should like, however, to express my doubt as to the possibility of regaining compression by the expedient of fitting new rings as he meditates.

The reason is this: The importance of having properly fitted rings cannot be exaggerated, and to be properly fitted the points of the rings should just meet when in the cylinder. If this be granted, it is obvious (the cylinder in question being taper to the extent of 2 mm.) that if the points touch at the bottom of the cylinder they will separate to no less than 6 mm. at the top, and this is just where they should be perfect, having to sustain the greatest force of the explosion. These remarks are not only theory, but the practical experience of an ENGINEER.

Twin-cylinder Ignition.

[3450.]—"Ixion's" article, "Contact Breakers for Twin-cylinders," induces me to write you, as it has an indirect bearing on a question which has occupied my mind for some time.

A month or more ago there was in your columns a query in reference to a magneto for two cylinders at 90°, and the editorial opinion was to the effect that it would not be satisfactory, as it would "split up the magnetic field too much"—an explanation, doubtless, all-sufficient to the expert, but leaving something to be desired from the point of view of the novice. I have been trying to puzzle the matter out by the aid of diagrams, and concluded that the difficulty would exist only if the two cylinders acted on the same crank. If cranks as well as cylinders were at 90° it seemed to me that a magneto with distributor would be entirely satisfactory. Is there any reason why this arrangement, by which I understand a capital balance of engine can be obtained, is impossible, or highly objectionable, as my ideal for a twin would be to have cylinders at 90°?

Has no one yet produced a magneto in which the advance and retard of spark is produced in the scientifically correct way, viz., by swinging the magnets round the axis of the armature—an arrangement which would give practically the same flexibility as accumulator and coil? I believe it has been done on a motor car. S. F. W.

The Newcastle-on-Tyne representatives in the End-to-end Trial were (reading from left to right): Capt. Sir R. K. Arbuthnot, Bart., R.N., A. D. Nicholson, S. W. Carty, and W. H. Outwin. All are members of the local motor cycle club, and all gained gold medals.

'N.S.U.'

Reliability

in long distance covering under trying conditions was again to the fore in the A.C.U. Land's End to John-o'-Groat's Reliability Trials, the results being:

Mr. S. W. CARTY, on his $3\frac{3}{4}$ h.p. single cylinder

N.S.U.--GOLD MEDAL

Mr. M. GEIGER, on his 6 h.p. twin-cylinder

N.S.U.--GOLD MEDAL

Both these riders and machines completed the long ride—probably the severest test to which a motor cycle could be put—without the loss of a single mark. It's the N.S.U. way all the world over.

Do you ride one?

Read Mr. Carty's Letter.

July 20th, 1908.

Messrs. The N.S.U. Motor Co.
Gentlemen,—In the recent A.C.U. Land's End to John-o'-Groat's Reliability Trials I gained Gold Medal with the loss of no marks on my $3\frac{3}{4}$ h.p. N.S.U. (two-speed gear). I had a splendid ride in spite of continual rain and bad and greasy roads, the machine giving me every satisfaction. The two-speed was a source of joy to me, as I was able to climb hills and face head winds, using it where machines of greater horse-power and less total weight miserably failed.

(Signed) S. W. CARTY.

Things you ought to have:

N.S.U. non-skid device 3/6

N.S.U. sparking plug.

N.S.U. belt fasteners.

N.S.U. two-speed gear.

Models from
 $1\frac{1}{4}$ h.p. to
6 h.p. twin.

CO., LTD.,
78, Charlotte St.
London, W.

In answering this advertisement it is desirable that you mention "The Motor Cycle."

Belts and the Kld-gloved Brigade.

[3451].—As another rider who likes to keep clean, I am pleased to endorse letters contributed [3428 and 3414]. When I was using leather belts my chief complaint was the dirty nature of same, and the necessity of constant truing up of pulleys due to the belt dressing acting as a medium for gathering and carrying grit and small flints, causing excessive grinding and wear of pulley sides. This was not very noticeable on my low-powered machines, but as for three years now I have been riding heavy twins (my present one 9 h.p.), I certainly prefer the rubber and canvas belt as being quite clean to handle, and practically no wear on pulley. Even if the life of the belt is not so long as leather, I think that the trouble and expense incurred by truing up or replacing worn pulleys, saved by using a rubber belt, more than compensates for a more frequent renewal of belt. One point I would like to mention is that, provided the machine is intelligently looked over before a ride, there is little or no need to dirty one's hands; in fact, for dry weather in summer I wear white gauntlet gloves, and these I only pipeclay once a week (Saturday night), and frequently after a week's riding (300 to 500 miles) they scarcely require the weekly clean.

TEN THOUSAND A YEAR (MILES, NOT £'s).

Motor Cycle and Cycle Speedometers.

[3452].—It is surprising speedometers are not more general. I have had two Goodlad speedometers in constant use for about fifteen months, and find them reliable, especially since a slight improvement suggested by me to Messrs. Markt and Co. has been adopted by them, which consists in using a slotted sleeve for the lower end of the flexible shaft to engage with, this coupling allowing the end to rise and fall, thus obviating the sudden jars which formerly caused the shaft to break occasionally, which it never does now. I have tested these speedometers on a good piece of road between milestones and against a watch, and found them substantially accurate and steady. After using one, one finds it almost indispensable, because if a rider has been travelling fast and suddenly drops his speed ten miles per hour he is apt to think he is travelling slowly, whereas he may be travelling at a greater pace than circumstances justify, and in such a case a handle-bar speedometer will warn him. I carry a watch, mirror, speedometer and altitude aneroid on my handle-bar, and a Veeder trip cyclo-meter for the front wheel, but the instrument I would least care to dispense with is the speedometer.

It may be of interest to some readers to learn that speedometers were designed, made, and tried on the old high pedal bicycle. I think I may claim to have originated the first bicycle speedometer. Its principle of action was that of an engine governor, but the centrifugal mechanism, instead of controlling the throttle, was to move a pointer over a dial. I communicated my idea to my friend, and then instructor, Prof. Hele-Shaw, now Dr. Hele-Shaw, F.R.S., who informed me my idea had been anticipated in the

Hearson strophometer, but he felt sufficiently interested in it to work out the idea in conjunction with his brother, my brother-in-law, Mr. Ed. Shaw, who devised an arrangement in combination with a front wheel brake. Those interested will find the instrument illustrated in Dr. Hele-Shaw's paper on the measurement of velocity for engineering purposes in Part III. page 47 of Vol. LXIX. of the Min. Proc. Inst. C.E., to a complimentary copy of which paper given me by Dr. Hele-Shaw I have referred.

Several instruments were made by Messrs. Husbands, opticians, of Bristol, and I took these to Messrs. Singer and Co., of Coventry, who were then working a patent of mine under royalty, and they tried them. Mr. Lea, of Lea-Francis, Ltd., will probably remember the trial of one instrument on a special British Challenge of his. I believe I could find one of the instruments now. The dust which forced its way in owing to the combination of the indicator roller in the brake prevented the instrument becoming a success—a disadvantage which is absent from the Goodlad speedometer.

A. WHARTON METCALFE,

Asso.M.Inst.C.E., etc., etc.

Handle-bars Working Loose.

[3453].—Your correspondent "BS 31" [3413], in your issue of the 15th inst., has written in hot blood, and doubtless his alleged repairer was much to blame, probably far more than the design of the grip securing the handle-bar.

But an absolutely definite fastening has many disadvantages, viz., comparatively expensive to manufacture, and difficult to make and maintain the bars in true alignment.

When a motor cycle falls over, the cranks and footrests get most of the shock; they bend, and sometimes break when being straightened. What a misfortune this would be if it happened to a firmly fixed handle-bar, instead of which the stem swivels a little and the bar can easily be pulled straight again when the bolt is loosed.

I am far from disputing the need of an extra fastening, but the $\frac{1}{4}$ in. bolt mentioned will probably work loose, and has, undoubtedly weakened the handle-bar stem, which will probably break at this point next fall.

Makers of pedal bicycles have been through all phases of this question in bygone years. Commencing with definite fixing, and progressing through many designs of set pins and binding collars, the long bolt and expander cone are now in use by many leading firms, and can be easily fitted to any motor cycle handle-bar in addition to the existing fastening (see rough sketch). The stem wants a saw cut, or perhaps two are better, to allow the cone to expand the tube quite easily. The degree of tightness obtained is quite remarkable.

Special Features

Next Week's Issue a Day Later.

The next issue of *The Motor Cycle* will be published one day later than usual on account of the August Bank Holiday.

Motor Cycling in the Antipodes.

We understand that N.S.U. machines were successfully placed in the Adelaide Motor Club's annual hill-climb, South Australia.

Description of the End-to-end Record.

Mr. Arthur W. Bentley, the present holder of the Land's End to John-o'-Groat's record, has written for *The Motor Cycle* a graphical account of his record ride last month on a Triumph, and the first instalment of the article will appear in an early issue.

Five Miles Race.

On August Bank Holiday, the Anerley Bicycle Club will include a five miles open motor cycle race for tourist machines at its race meeting at the Crystal Palace. Machines must be fitted with engines not exceeding 85 x 85 mm. or the equivalent volume swept out. Gear limited to 4 to 1.

Boat Racing at Henley.

For the contests at Henley in connection with the Olympic Games (Tuesday to Thursday, July 28th to 30th), members of the Auto Cycle Union can obtain tickets for the *Bystander* enclosure at the reduced rate of 5s. for one day (instead of the usual price of 7s 6d.) The enclosure is situated between Phyllis Court and the Lawns Club, close to the winning post and judge's box.

The Dover Road.

Motor cyclists who contemplate visiting Dover this summer should make a note that for good scenery and roads the route *via* Eltham, Farrington, Wrotham, Maidstone, Lenham, Charing, and Canterbury is recommended in preference to the one *via* Dartford, Gravesend, Rochester, and Chatham. The A.A. is giving special attention to the matter of the Dover roads, as it is expected there will be a good deal of traffic on the above mentioned routes during the next few weeks.

Rund um Berlin.

This event will take place on August 18th over a circuit of nearly 250 kilometres, the start being north of Bornin, in the neighbourhood of Potsdam, and the finish at Klein-Machnow. It is not a race, but a purely economic trial, neither time nor mechanical defects constituting determinative factors for awards, the "unknown" being simply the quotient resulting from weight carried divided by fuel consumed. Entrants must belong to one of the clubs affiliated with the German Cycling Federation (amateur interest).

New President of the F.A.M.

Earle L. Ovington, of New York, has by a large majority been elected president of the Federation of American Motor Cyclists.

Motor Cycles Not Carried.

For the benefit of tourists we would state that motor cycles are not carried on the Palace or Bell boats that run to Margate, Ramsgate, Dover, Clacton, etc.

Reaper Seats for Motor Cycles.

A few weeks ago a correspondent tells us he ordered from a small firm of accessory dealers a pan seat for a motor cycle, and, naturally, expected to get something similar to a Brooks or Phoenix pan seat. Judge of his astonishment when he received an iron perforated pan seat on the lines of those fitted to reaping and mowing machines. The price was small, but the astonishment of our correspondent was great.

Police Traps.

On the main road between Launceston and Camelford, Cornwall.

Near Builth Wells—one a quarter of mile and the other threequarters of a mile in length.

Near Llandrindod Wells.

Lancaster, from the Bay Horse, five miles north of Garstang to Burton, thirteen miles north of Lancaster.

Between Fulwood (two miles north of Preston) and Burrow Beck Bridge, Scotforth (two miles south of Lancaster), a total distance of eighteen miles.

THE END-TO-END RESULTS AT A GLANCE.

IMPRESSIONS OF THE TRIAL.

Racing at West Ham.

At a meeting at the Memorial Grounds, Manor Road, West Ham, on Bank Holiday Monday, August 3rd, the Essex Beagles A. and C.C. has included an open ten miles motor cycle handicap, limited to machines with a cylinder capacity not exceeding 76 x 76 mm., or equivalent volume swept out.

A Motor Cyclist's Success.

G. H. Curtiss, the well-known American motor cycle manufacturer, has won *The Scientific American* Trophy, valued at 2,500 dollars, for the first machine of the "heavier than air" type to cover one kilometre in a straight line. He covered a mile in 1m. 42½s.

Courtesy on the Road.

We make a special appeal to motor cyclists to refrain from creating unnecessary noise and dust at the various seaside and holiday resorts during the next month or six weeks. Courteous treatment of other road users will do a lot of good to the pastime. Motor cyclists should drive slowly in traffic and refrain from using cut-outs.

At the Frontier on a Motor Cycle.

We know that motor cyclists will be interested to read of a gallant officer's exploits on a motor cycle during the recent expedition against the Mohmands on the North Western Frontier of India. This gentleman considers his Triumph has earned the medal, therefore a bit of the ribbon will decorate the handle-bar. He used the low gear entirely, as can easily be imagined in such a country, yet the engine never showed a sign of overheating.

REX riders in the End-to-end Trial achieved a remarkable performance. Eight started and all finished. Seven of the competitors are seen above at John-o'-Groat's, the other arrived after the photograph was taken.

Shoes of the Trials.

A competitor to whom the corner on Berriedale hill came as a great surprise jumped off on reaching it and exclaimed, "Good Lord! Have I to go up there?"

A farmer who saw one of his labourers leading a horse in the middle of the course called out in a loud voice: "Will ye no keep to the left?" They are true sportsmen in the far North.

Mr. J. Tassell writes that he did not experience a single puncture in the End-to-end Run, although our report last week said that he punctured on the second day. The back tyre, however, was badly cut, and getting rather anxious at the Worcester control, he stripped the cover and backed it with canvas. The tyres were Modèle de Course Continentals.

Policeman's Motor Bicycle Stolen.

For clear unadulterated "cheek," an American paper instances the case of a twin-cylinder motor bicycle belonging to the New York Police Department, which was recently stolen from outside a constable's house. The officer had taken the precaution to chain the machine to a post in front of his house, but on returning a few minutes later he found that the post had been cut down and the machine had disappeared.

Auto Cycle Union London to Plymouth and Back Ride.

Mr. G. H. Levick has kindly offered to present the Auto Cycle Union with three silver cups, to be awarded in connection with the twenty-four hours ride from London to Plymouth and back, a distance of about 120 miles. The start will take place from the Angel Hotel, Thames Ditton, at 9 p.m. on Friday, August 7th, and the route followed will be *via* Guildford, Salisbury, Yeovil, Honiton, Crewkerne, Exeter, Ivybridge, Plymouth, and the reverse for the return journey.

Meeting at Portmarnock.

The motor cycle race meeting at Portmarnock, fixed for Saturday last, had to be postponed owing to wet weather.

Daring Theft of a Motor Bicycle.

Mr. H. C. Pickering writes: "I should like, through the medium of your valuable paper, to warn advertisers of second-hand motor bicycles who reside in the suburbs of Birmingham against allowing trial runs to a prospective purchaser of the following description: Respectable looking man, age 30-35, short, fair, rather stout, wears brown leggings and boots, and possesses an unbounded cheek. This said person paid a visit to a member of the Worcestershire M.C.C., and after about two hours' conversation asked for a trial run, which was granted, and of course, the machine (a 3½ h.p. Ariel) vanished into the night. Fortunately the owner suspected foul play and lost no time in informing the police, who immediately telephoned a full descrip-

tion of the missing machine and rider to other sub-stations in the neighbourhood, and within two hours succeeded in making an arrest of a person who had the motor in his possession, only to find that he was the wrong man, the thief having stopped the other person (a cyclist) and asked for assistance, as the steering socket bearing had gone wrong. While the unfortunate cyclist was examining the engine the other individual was smart enough to mount the pedal bicycle, snatch the motor lamp and disappear, leaving the poor cyclist with an unlighted pedal-less motor bicycle. Fortunately, the police have an excellent description of the thief, and hope to trace him and so stop his 'confidence trick.'"

M.C.C. Run for the Jarrott Cup.

Competitors in the M.C.C. London to Land's End and back run will be started from the Berkeley Arms, Cranford Bridge, near Hounslow, on Mon-

Blue Anchor, Mitchell, Redruth, Penzance, Land's End, and back to Penzance. Return—Penzance and continue eastwards *via* Redruth, Mitchell, and the route as above in reverse direction, finishing at Cranford Bridge. Secret controls will be arranged along the route. The first prize is the Jarrott Cup, and medals will be awarded, at the discretion of the committee, to those riders accomplishing the most meritorious performance. Bronze or silver medals will be awarded to all competitors completing the double journey within thirty-three hours. This run will be immediately followed by the A.C.U. twenty-four hours ride.

Harry Martin will Attempt to Break Record.

Harry Martin, who is now recovering from the effects of a fall, hopes to ride at Glasgow on August 8th in an attempt on record.

A Valued Gift.

Miss Hind was the proud recipient of a handsome little souvenir one day last week. It had been subscribed for by a few of the employees of the Rex Motor Manufacturing Co. as a token of their appreciation of a plucky performance. The souvenir contained several of the subscribers' wishes and congratulations in both prose and verse. The gift was quite a spontaneous one, and therefore all the more valued by Miss Hind, who told us that she prized it far more than any other gift in her possession. One of the cards bore the following inscription: "We heartily congratulate you on the indomitable pluck and perseverance you displayed in your recent motor cycle ride from Land's End to John-o'-Groat's, and in appreciation of same we beg you to accept a small token from a few well wishers of the Rex Manufacturing Co., Ltd." Many people think a dropped frame ladies' machine is more prone to side-slip than a diamond-shaped man's machine, but Miss Hind never experienced the

slightest sign of side-slip all the way from Land's End to John-o'-Groat's. With regard to the tyres, a Continental butted tube, which was lent to her at Worcester, lasted the remainder of the journey without further inflation.

Police Traps in North Wales.

Riders will do well to drive carefully in and around the following districts, where the police are preparing for Bank Holiday: Corwen, Llangollen, Mold, Penmaenmawr and Llanfairfechan, Llanddulas (between Abergele and Old Colwyn), Bettws-y-Coed and Capel Curig. Also at Talycafn, between Talycafn Station and Bodnant Hill, a trap is working, this lies between Llanrwst and Llandudno Junction, on the Denbighshire side of the Conway river (the Rhine of Wales). The police are also active at Ruabon, near Wrexham. They hide behind a hedge, and anyone coming round at anything above "funeral" pace is summoned for "reckless driving."

FUTURE EVENTS.

- Aug. 3.—Essex Beagles A. & C.C. 10 Miles Handicap, Memorial Grounds, Manor Road, West Ham.
- " 3.—Anerley B.C. 5 Miles Race for Tourist Machines at the Crystal Palace.
- " 3-4.—Motor Cycling Club Run to Land's End and back for Charles Jarrott Cup.
- " 7.—A.C.U. 24 Hours' Ride London to Plymouth and back.
- " 8.—Essex M.C. Open Race Meeting at the Stadium.
- " 15.—Coventry M.C. Open Hill Climb for Motor Bicycles and Passenger Motor Cycles at Newnham Hill, Daventry.
- " 21-22.—Motor Cycle Union of Ireland Open 400 Miles Reliability Trials for the Muratti Trophy.
- " 22.—A.C.U. Annual Race Meeting at the new Stadium, Shepherd's Bush.
- " 22.—General Inter-club Meet of Motor Cyclists at Stratford-on-Avon, organised by the Birmingham M.C.C.
- " 29.—Essex M.C. Open 200 Miles Non-stop Run for Motor Cycles.
- Sep. 12.—Motor Cycling Club Petrol Consumption Tests.
- " 23.—The International Auto Cycle Tourist Trophy Race in the Isle of Man.
- " —Penalty Run for Members of the A.C.U. and Clubs in the South of England Districts affiliated to it.
- Oct. 3.—A.C.U. Council Meeting at Warwick.
- Nov. 20-28.—Thirty-second Annual Stanley Show.

day next, the 3rd prox., at 4 a.m. Riders will be despatched at two-minute intervals, and competitors will be allowed approximately sixteen hours to complete the outward run. A stop of seven hours will be allowed at Penzance, and fifteen hours approximately will be allowed for the completion of the return journey on Tuesday. The route is as follows: Outwards—Cranford Bridge, Staines, Basingstoke, Andover, Salisbury, Shaftesbury, Sherbourne, Yeovil, Crewkerne, Chard, Honiton, Exeter (control), Okehampton.

Next week's issue of "The Motor Cycle" will be on sale on THURSDAY instead of Wednesday, on account of the August Bank Holiday.

CLUB NEWS.

Western District M.C.

Messrs. Canham and Vowler, who tied in the reliability competition to Salisbury and back, ran off the tie on the 19th inst., and Mr. R. Canham has since been declared the winner.

Birmingham M.C.C.

A week-end run to Llanrhaiadr has been arranged for August 1st to 3rd, meeting at the Fountain, 2 p.m. On August 8th the run is to Maxstoke Priory, and on the 9th to Matlock, 15th Ashby, and 22nd inter-club meet at Stratford-on-Avon.

Walthamstow M.C.

The second round of the 100 miles competition was held on the 6th inst. for the Dinner Cup. The following made non-stops: O. C. Godfrey (5 h.p. Twin Rex magneto), F. A. Applebee (3½ h.p. Rex magneto), J. W. Percival (6-8 h.p. Fafnir Tricar magneto), L. Beckers (5 h.p. Kerry Tricar, accumulator), and A. H. White (car, accumulator).

Members are reminded that the non-stop run to Clacton-on-Sea takes place on Saturday, August 1st, starting from the Castle Hotel, Woodford, at 3.30 sharp.

Hull and East Riding A.C.C.

On Saturday last July 25th, a cricket match was played at West Ella, near Hull, between the Hull and East Riding Auto Cycle Club and the Central Hull Conservative Bicycle and Motor Club, and resulted in a victory for the former club by sixty-seven runs, the Conservatives only scoring seven. Tea was afterwards partaken of at Mr. Godsell's, Red Lion Hotel, Anlaby.

The next item on the club's programme is the non-stop run (200 miles), Hull, Bridlington, Scarborough, Malton, York, and Hull, on August 13th. A party are also arranging a tour to Whitby for Bank Holiday. Particulars of the secretary.

The hill-climb announced for July 23rd had to be postponed.

Sunderland and District M.C.C.

This club held its annual picnic on Wednesday last. Nine members rode from High Barnes, Sunderland, to Finchale Abbey, which is close to the main road to Durham, and near Leamside Station. They partook of tea in the Abbey grounds, and afterwards toured the surroundings of the beautiful ruins, returning to Sunderland at about 8 p.m.

This evening (July 29th) there will be a speed-judging contest under the auspices of the club. The competitors are

to start from Chester Road, Sunderland, proceeding on their motor cycles to Chester Bridge, Plainsworth, and Framwellgate Moor. All these places are in Durham county, and the last mentioned is in Durham city. The return journey will be made *via* Cocken Bridge (on River Wear).

M.C.U.I. (Ulster Centre).

The open 400 miles reliability trials for the Muratti trophy will take place on August 21st and 22nd. Entry forms and all particulars regarding the competition can be had from the secretary, E. B. Waring, Grand Central Hotel, Belfast.

North Monmouth M.C.C.

A meeting was held on the 23rd inst., at Ebbw Vale, when it was decided to form a motor cycle club to be known as above. Sixteen members were enrolled, and it was resolved to hold the first run on Saturday next, August 1st. All riders in the North Monmouth district are cordially invited to join in the run. A general meeting will be held on the 19th prox. at the Givalin Restaurant, at eight o'clock. The hon. sec. is E. Griffin, 2, Victoria Road, Ebbw Vale.

York County M.C.C.

On the 18th inst. a twenty-four hours reliability run from Leeds to Edinburgh and back was held. For this event the Palmer Tyre Ltd. presented a handsome silver challenge cup, to become the absolute property of the rider accomplishing the best performance. The weather was very threatening at the start, and only twelve members faced the starter. Mr. A. Gordon Bostock, of Glasgow, came over specially to Leeds to take part in the run. The first competitor was despatched at 9 p.m., the others following at intervals of one minute. Before the riders had covered a dozen miles a drizzling rain set in, which made it extremely uncomfortable. A heavy downpour had made the roads like a quagmire, and, moreover, this part of the journey was covered during the hours of darkness. Several riders took the wrong turn south of Neville's Cross and lost a considerable number of marks in consequence. From Neville's Cross through Chester-le-Street and Newcastle, the roads are bad at any time owing to the poor surface; pools of water, however, now filled up the holes, and several competitors decided at this point to wait until daylight came. At the checking station at Alnwick only four competitors arrived to schedule time, viz., Wilkinson, Charge, Ward, and Mitchell. Good progress was made to Berwick-on-Tweed, where breakfast was partaken of. The other side of Berwick no rain had fallen much to the satisfaction of the riders, and the return journey was

A.C.U. Land's End to John-o'-Groat's Trial. Competitors starting from Moffat, 382 miles from John-o'-Groat's, on the morning of the 16th inst.

Club News.—

made under far more favourable conditions. Between Dunbar and Berwick-on-Tweed a part of the North Sea squadron which had taken part in the recent naval manœuvres was seen by the riders as they passed along that very picturesque coast road between the towns mentioned.

The first man arrived at Roundhay Post Office, Leeds, close upon schedule time, and others followed at regular

The A.C.U. End-to-end Trials. W. H. Outwin (3½ h.p. Triumph) passing through Carlisle.

intervals. H. Wilkinson, of Roundhay, who was riding a 3½ h.p. Triumph, has been officially returned the winner of the Palmer trophy. The following competitors also arrived within schedule time, and will be awarded the club's standard gold medal: W. C. Ward, H. H. Charge, F. W. Savory, J. C. Bennett Mitchell, C. Wilson, W. E. Asquith, A. Gordon Bostock, and W. R. Steel.

It is interesting to note that only three competitors failed to finish, in each case due to some slight accident.

Members are requested to note that the speed trials will take place in August for the Charge challenge cup. The trials hon. sec. is now endeavouring to obtain permission for this event to take place in private grounds.

It is worthy of note that in the above long-distance run for the Palmer Cup, eight out of twelve of the competitors used Palmer tyres. Seven duly finished, and the eighth retired through a collision. The seven riders in question experienced absolutely no tyre troubles from start to finish.

Newcastle and District M.C.C.

The third annual reliability trial for the N.S.U. cup will take place on August 2nd and 3rd. The second prize is the A.C.U. gold medal; third, special prizes presented by Mr. Ernest Hawkins. Gold medals will be awarded to all who finish between minimum and maximum time, and bronze medals to those who finish within forty-eight hours. A gold medal will be given by Mr. S. Hudson to the rider who has not previously won any club award, or who accomplishes the best performance in the opinion of the judges.

Route: August 2nd, leave Northumberland Street, Newcastle, at 6 a.m., *via* Wooler to Kelso. Control and breakfast, half an hour. Leave for Moffat *via* Selkirk and St. Mary's Loch. Control and dinner, one hour allowed. Leave for New Galloway *via* Beatloch, Elvanfoot, and Thornhill. Control and tea, half an hour. Leave for Stranraer *via* Newton Stewart. Stop for night, arrive about 7 p.m. August 3rd (Bank Holiday), leave Stranraer 8 a.m. for Castle Douglas. Control and breakfast, half an hour. Leave for Langholm *via* Annan and Canobie. Control and dinner, one hour. Leave for Redesdale Arms *via* Hawick and Carter Bar. Control and tea, half an hour. Leave for Barras Bridge Hotel, Newcastle, *via* Otterburn. Arrive about 8 p.m.

Southend and District M.C.

The winner of the two motor cycle events at this club's gymkhana, viz., the Turk's head competition and potato race, was A. W. Pettitt who rode a 2½ h.p. Quadrant-Jap.

Coventry M.C.

The trials hon. sec., 19, Hertford Street, Coventry, advises us that entry forms and particulars for the above club's open motor cycle hill-climbing competition are now ready. No entries can be received after August 8th.

Brighton and District M.C.C.

The above club held a speed-judging competition over a circuit ten and a half miles round, situated near Henfield. Competitors before starting were required to draw a sealed envelope, which contained a number, and were required to cover the course in a time as nearly approximating the drawn number (representing minutes) as they could without the aid of watches, etc. The results are given below:

Rider and machine.	Number drawn.	Error.
H. Saunders (6 h.p. Jap) ...	25	11s. slow
T. Wilkins (4½ h.p. Minerva) ...	29	45s. fast
E. L. Waters (3 h.p. Rover) ...	38	1m. 54s. slow
G. R. Brown (4½ h.p. Minerva) ...	26	1m. 35s. slow
J. H. Best (4½ h.p. Minerva) ...	25	2m. 15s. slow
T. Rollin (3½ h.p. F.N., 4-cylinder) ...	32	3m. 30s. fast
J. D. Box (3½ h.p. Triumph) ...	40	4m. 40s. slow
R. W. Cartwright (7-8 h.p. Minerva) ...	37	4m. 40s. slow
C. E. Sambrook (5½ h.p. N.S.U. and sidecar) ...	39	did not finish

North-west London M.C.C.

A petrol consumption trial was held near Stanmore on Saturday last, 25th inst. Some good sport was witnessed, and the performances of the leading competitors were excellent. The full results were as follows:

Place.	Rider and Machine.	Allow- ance of petrol. pt. oz.	Distance covered. Miles.
1.	W. A. Jacobs (3½ h.p. Rex) ...	1 1	22 ⁷ / ₃₂
2.	A. W. Bentley (3½ h.p. Triumph) ...	1 1	22 ⁹ / ₁₆
3.	T. G. Blundell (3½ h.p. Triumph) ...	1 1	15 ³ / ₈
4.	G. H. Hollis (3½ h.p. Triumph) ...	1 1	15 ⁷ / ₁₆
5.	W. O. Kennington (3½ h.p. Triumph) ...	1 1	13 ¹³ / ₁₆
6.	H. V. Davidson (3 h.p. Werner) ...	1 0	12 ¹ / ₈
7.	G. Rowden (3½ h.p. Bat) ...	1 2	11 ¹ / ₂
8.	A. S. Phillips (5 h.p. Vindec) ...	1 2	11

F. Thomas (5 h.p. G.O.K.), E. W. Brighten (2½ h.p. Ariel), and F. Fox (3½ h.p. Quadrant) also ran, but stopped during the trial.

W. H. Wells (5 h.p. Vindec) leaving the Star Hotel, Worcester, after the lunch interval on the second day of the End-to-end Trials.

Club News.—

Ayr and District M.C.C.

A petrol consumption test was held last Wednesday evening over a circular course of twelve miles embracing Greenhill and Longhill Avenues. A start was made at 8 p.m. from Mr. Johnstone's grounds at Alloway, kindly placed at the disposal of the club for the occasion. The results, based on the formula, $\frac{\text{Total weight} + \text{capacity}}{\text{Petrol (in ounces)}}$ were as follows :

		Fig. of merit.	Petrol ozs.	Miles per gallon.
1.	Q. Clark (5 h.p. twin Rex)	40.7	27	= 56.8
2.	J. Robertson (3½ h.p. Minerva)	40.6	19	= 80.8
3.	C. Carver (3 h.p. N.S.U.)	40.3	16.5	= 92.2

Hartlepoons and District M.C.C.

The result of a petrol consumption test held by the above club on Wednesday, July 22nd, is as under. The course was one of eighteen miles, and was not by any means flat :

Rider and machine.	Quantity used liq. ozs.	Miles to the gallon.
*Mr. Smart (3½ h.p. Phelon and Moore) ...	20	= 144
Mr. Atkinson (3½ h.p. 1907 Triumph) ...	21	= 137½
Mr. Walton, jun. (3½ h.p. 1908 Triumph) ...	26	= 110½
Mr. Durkin (four-cylinder F.N.) ...	30	= 96
Mr. Corner (3 h.p. 1906 Triumph) ...	32	= 90
Mr. Edwards (5 h.p. Twin Stranton) ...	33	= 87⅓
Mr. Dyer (3½ h.p. Triumph) ...	40	= 72

* Winner.

THE ORGANISATION OF MOTOR CYCLISTS.

FOR some months we have known that the Motor Union has had under consideration the question of the organisation of motor cyclists, i.e., the banding together of all motor cyclists, whether club men or unattached riders, under one banner. We

have not hesitated to point out faults in organisation when we have thought that the general body of motor cyclists was being neglected.

The Motor Union, 1, Albemarle Street, W., has now taken the bull by the horns, and issued a prospectus which includes among other advantages full membership of the Motor Union and reduced fees for insurance at an inclusive fee of half a guinea. Our ideal subscription for unattached riders to a representative body has been stated in our articles as 5s. We think motor cyclists will find that the M.U. subscription of half a guinea brings the actual fee slightly under this sum, when all the advantages enumerated in the prospectus are taken into consideration.

In addition to the half-guinea scheme the M.U. has an alternative subscription of one guinea, which includes all the advantages of the first-named, with the added security of insurance for any motor cycle not exceeding 5 h.p., claims by the public (which are always possible) for injury or damage (excluding the first £2 10s.) up to £50, and fire or explosion up to £30.

A special committee composed of representative motor cyclists will deal with all questions appertaining to motor cycling.

Finally, it is interesting to note that the M.U. has a definition of its own regarding the motor cycle type of vehicle. It reads as follows: "A motor vehicle not exceeding 4 cwt. in weight, excluding petrol, oil, water, accumulators, or magneto, and having not more than three wheels, except in the case of a motor bicycle or trailer."

Further particulars can be obtained from the secretary as above.

A.C.U. Trials (Fourth Day). Competitors riding through Lanark.

have shown our readers, by articles we have published in these pages, that in our opinion a universal scheme at a moderate fee would meet the case, and we

Mr. Cathcart Wason, M.P., asks Another Question.

WE understand that Mr. Cathcart Wason, M.P., was to ask the President of the Local Government Board on the 28th inst., whether his attention has been drawn to the conviction for dangerous driving through Croydon of one of the competitors in a motor cycle race from London to Edinburgh; and whether, etc., etc. In his zeal for the protection of the public Mr. Cathcart Wason has overlooked one or two important facts. One is that Croydon is not on the route to the North, another is that the M.C.C. London to Edinburgh ride is not a race, and the last is that the alleged dangerous driving took place in Chester-le-Street, near Durham, and that the

riders name was Reginald G. Mundy, of Croydon, and he was most unjustly punished by a bench of magistrates, who might very reasonably have overlooked the alleged danger, considering everyone was on the *qui vive* for the Edinburgh riders and knew they were due.

We are informed by Douglas Bros., Kingswood, Bristol, that the sole cause of their machines not being successful in the A.C.U. End-to-end Trials was owing to the fact that the front forks were of a new design, and proved unequal to the task they had to perform. The makers have now arranged to fit to their Douglas machines a specially-made Druid spring fork.

OCCASIONAL COMMENTS.

By "IXION."

Tyre Pumps.

As if we did not already pay enough for our tyres in view of their brief lives and the worry they give us while they last, the tyre makers continue to supply with a pair of motor cycle tubes and covers costing £5 or so a miserable little inflator only big enough to blow up a pair of red naked-sided road-racing Constrictors. Every pair of motor cycle tyres ought to possess a real motor cycle pump—a businesslike affair with a stout barrel, a hefty hand grip, and a folding heel for the foot to stand on. Riders still employing last year's wretched apologies for pumps may have noticed their tyres seem to demand a greatly increased expenditure of perspiration when they call for inflation. Lucky are you if your pump has a screw-on cap, so that you can get at the piston, and put a little vaseline on the bone dry washer. Mine has a cemented cap, and adds to its other iniquities this, above all, that before I can ever blow up my tyres again with it I must spend money on a celluloid repairing outfit, melt the cap off, grease the washer, and see if I can make a good joint at the cap again. All pumps should have screw-on caps, so that the piston washer may receive the periodic greasing it requires.

Brakes for Chain-driven Machines.

Motor cyclists—consciously or unconsciously—possess the best brakes fitted to any vehicle on the road, in the form of the foot-operated belt rim shoe. It is immensely powerful, can be used at need with extreme delicacy, is absolutely reliable, and never needs adjustment. Chain-driven machines, on the other hand, still have to depend on other types of brake, which may be excellent when in perfect order, but comprise a number of fragile parts, and are often in need of adjustment, the want of which either destroys the brake power or reduces the efficiency of the machine. I saw a new model of chain driver, built for the End-to-end trial, which included a belt rim brake. A rim of very narrow section had been fastened to the

spokes of the rear wheel, on the opposite side to the sprocket, and a belt rim shoe brake attached, operated from the footrests. Most chain-driven machines on the market have sufficient fork clearance to allow of such a brake being fitted, and it will be found of especial value for side car work. A similar brake is fitted to the back wheels of an experimental small car, of which I was permitted to see the drawings last week, and the designer says it is the best car brake he has ever used, though the rims scarcely add to the appearance of the wheels.

Accessible Cylinders.

I recently saw a device for rendering the cylinders accessible fitted to a freak home-built machine. The machine possessed a colossal engine built into an ultra low racing frame. The designer did not see the fun of taking the engine off the frame whenever he wished to dismount a cylinder, and yet he had set his heart on a very low frame which gave no clearance whatever for lifting the cylinder off with the crank case *in situ*. *Nil desperandum*. Readers may know that one end of the Vindex twin engine is held by a clip, which can be revolved on the frame when two bolts have been loosened. The designer in question has fitted each crank case clip so that it is free to revolve across the vertical plane, and has prevented it from revolving of its own accord by fitting two easily detachable tie rods at one end. Consequently when he wishes to detach his monstrous cylinders he whips off the two tie rods, unscrews the carburetter unions, pushes at the cylinder heads, and pulls at the bottom of the crank case, when, hey presto! his engine lies horizontally across the frame of the machine, but still firmly secured to it. As a consequence he is able to use a racing engine with the valves set in the cylinder heads—an engine which would otherwise have presented considerable defects from his point of view. All twin-cylinder engines in low frames could be attached in this manner with a very small sacrifice of weight.

LEEDS—LONDON AND BACK TWENTY-THREE HOURS' TRIAL.

The winner, Eric S. Myers, of Bradford (3½ h.p. Triumph).

A successful competitor, T. W. B. Durant, of Sheffield (3½ h.p. Jap).

The Results of the End-to-end at a Glance.

No.	Rider.	Machine.	Ignition.	Marks Lost.	Result, Subject to Confirmation.	Remarks.
2	M. W. Randle	10 h.p. two-cylinder Lagonda tricar, 90 x 96, 700 x 80 Dunlops	Acc., R.O.M. contact br'ker	All possible	Bronze medal	Bent front axle, ignition troubles, worn sprockets; machine has been in constant use for over two years.
4	W. H. Wells	5 h.p. Twin Vindec, no pedals, 75 x 76, 26 x 2 1/4 in. Michelin non-skid back wheel	Bosch mag.	Nil	Gold medal	Condition excellent, no troubles.
5	W. Ridler	6 h.p. Twin Leader-Jap, 70 x 95	Accumulator	Retired	—	Gave up on second day, lubrication and other troubles.
6	E. Nelson	5 h.p. Twin Rex, 76 x 80, 26 x 2 1/4 in. Shamrock and Continental	Bosch mag.	All possible	Bronze medal	Carburettor trouble, on fire several times, reached John-o'-Groat's as others were leaving, got through by sheer perseverance; machine in good condition.
7	J. Tassell	3 1/2 h.p. Matchless-Jap, 85 x 76, 26 x 2 1/4 in. Continental	Bosch mag.	Nil	Gold medal	No trouble, condition excellent.
8	S. W. Carty	3 3/4 h.p. N.S.U., 82 x 86, N.S.U. two-speed gear, 26 x 2 1/4 in. Continental N.S. back wheel	Eisemann magneto	Nil	Gold medal	Choked carburettor, oil on magneto, front mudguard loose, bent pedal, stay of carrier broken, changed belt; condition good.
9	A. D. Nicholson	3 1/2 h.p. Triumph, 84 x 86	Bosch mag.	Nil	Gold medal	No engine or tyre trouble, bent footrest, wet on magneto, free-wheel trouble.
10	Gordon Gibson	3 1/2 h.p. Triumph, 84 x 86, 26 x 2 1/4 in. Shamrock and Michelin	Bosch mag.	Nil	Gold medal	Changed exhaust valve, one puncture, Shamrock belt, front wheel loose; condition good.
11	F. Dover	3 1/2 h.p. Triumph, 84 x 86, 26 x 2 1/4 in. Clincher	Bosch mag.	Nil	Gold medal	No engine replacements, seven punctures, new back tyre, bent footrest; machine in very good condition.
12	F. S. Barnwell	3 1/2 h.p. Rex, 82 x 90, Rex two-speed gear, 26 x 2 1/4 in. Palmer Cord	Bosch mag.	79	Gold medal	Various gear troubles, gear brake band worn and refused to grip, pin came out of starting handle-shaft, replaced exhaust valve, broke luggage-carrier, lamp-bracket, and mudguard, shortened belt once; condition fair.
13	Dr. H. R. Mayo	1907 5 h.p. Twin Vindec, 75 x 76, Vindec two-speed gear, 26 x 2 1/4 in. Palmer	Bosch mag.	All possible	*Bronze medal	Trouble with inlet valve springs, machine on fire several times, many tyre troubles.
15	M. Geiger	6 h.p. N.S.U., 75 x 90, 26 x 2 1/4 in. Shamrock back, P.U. front	Bosch mag.	Nil	Gold medal	No trouble; condition very good.
16	T. F. Cox	7 h.p. Twin Minerva, 80 x 85, 26 x 2 1/4 in. P.U.	Accumulator	Retired	—	Retired fourth day, engine trouble.
18	F. C. Mustard	3 1/2 h.p. T.T. Triumph, 84 x 86, 26 x 2 in. Dunlop	Bosch mag.	Nil	Gold medal	No trouble; condition excellent.
19	C. E. Murphy	3 1/2 h.p. Triumph, 84 x 86, 26 x 2 1/4 in. Palmer	Bosch mag.	Nil	Gold medal	No trouble; condition excellent.
20	W. H. Outwin	3 1/2 h.p. Triumph, 84 x 86, 26 x 2 1/4 in. Continental	Bosch mag.	8	Gold medal	
21	Miss Hind	5 h.p. Twin Rex, 76 x 80, free engine, 24 x 2 1/4 in. Shamrock	Bosch mag.	All possible	Bronze medal	Spoke heads came off and fouled clutch drum, back wheel rebuilt, carburettor on fire several times; otherwise condition good after trial
22	E. Gwynne	5 h.p. Twin Vindec, 75 x 76, 26 x 2 1/4 in. Michelin	Bosch mag.	125	Silver medal	Lost way on last day, ran out of petrol, and pushed machine four miles to John-o'-Groat's.
23	W. W. Douglas	2 3/4 h.p. Douglas, 60 x 60, 26 x 1 3/4 in. Shamrock	Bosch mag.	Retired	—	Broke forks.
24	P. Phillips	2 3/4 h.p. Douglas, 60 x 60, 26 x 1 3/4 in. Shamrock	Bosch mag.	Retired	—	Broke forks.
25	E. Clark	2 3/4 h.p. Leader-Douglas, 26 x 1 3/4 in. Shamrock	Bosch-mag.	Retired	—	Ran without losing a mark first three days, lost eighty-one marks fourth day, three miles beyond Wick broke steering-tube, and retired
26	R. W. Duke	3 1/2 h.p. Triumph, 26 x 2 1/4 in. Continental	Bosch mag.	Nil	Gold medal	Machine in good condition.
27	H. C. Hanrott	3 1/2 h.p. Triumph, 26 x 2 1/4 in. Shamrock	Bosch mag.	Nil	Gold medal	Three punctures, no trouble, same belt throughout; condition good.

* Joint Winner of Berrisdale prize.

No.	Rider.	Machine.	Ignition.	Marks Lost.	Result, Subject to Confirmation.	Remarks.
28	A. Manning Lomax ..	3½ h.p. Triumph	Bosch mag.	Nil	Gold medal	Bent pedal, pedal missing, magneto advance broken ; condition good.
29	G. Lee Evans	3½ h.p. Rex, 82 × 89, 26 × 2¼in. Continental	Bosch mag.	Nil	Gold medal	Machine and tyres in excellent condition. replaced tyre.
30	O. C. Go-frey	3½ h.p. Rex, 82 × 89, 26 × 2¼in. Shamrock ..	Bosch mag.	21	Gold medal	No engine trouble, same belt throughout, same tyres, excellent condition, no trouble with wet on magneto ; general condition excellent.
31	A. J. Sproston	5 h.p. Twin Rex, 76 × 80, 26 × 2¼in. Michelin	Bosch mag.	195	Silver medal	Machine in good condition.
32	F. W. Applebee	5 h.p. Twin Rex, 76 × 80, 24 × 2¼in. Continental	Bosch mag.	7	Gold medal	Condition very good, trouble with wet on magneto, first Lycett rubber belt, and then Gloria.
33	J. Slaughter	3½ h.p. T.T. Triumph, 84 × 86, 26 × 2¼in. Clincher	Bosch mag.	Nil	Gold medal	No engine trouble, magneto no trouble though without cover, one puncture, same belt, one wheel slack ; otherwise good condition.
34	J. Marshall	3½ h.p. T.T. Triumph, 84 × 86, 26 × 2¼in. Dunlop	Bosch mag.	Nil	Gold medal	Wet on magneto, same tyres and belt throughout, one puncture.
35	P. H. Cockcroft	3½ h.p. Triumph, 84 × 86, 26 × 2¼in. Clincher	Bosch mag.	Nil	Gold medal	Machine in good condition, bent footrests.
36	A. H. Ormerod	5 h.p. Four-cylinder F.N., 50 × 57, 26 × 2¼in. Palmer Cord	Bosch mag.	10	Gold medal	Condition good.
37	J. O. M. Dixon	3½ h.p. Two-speed Vindec, 82 × 85	Bosch mag.	86	Gold medal	Inlet valve and carburetter trouble, changed rear tyre, front wheel and mudguard loose, pedal broken, renewed spokes in back wheel ; condition poor.
38	T. K. Hastings	5 h.p. Twin Indian, 68 × 80, 28 × 2¼in. Goodrich	Bosch mag.	†17	Gold medal	Only replacements two plugs ; machine in excellent order. Chain-driven.
39	R. Moore	3½ h.p. Two-speed P. and M., 82 × 88, 26 × 2¼in. Palmer	Bosch mag.	Nil	Gold medal	Chain-driven machine and tyres in excellent condition, tyre replaced.
40	W. Milnes	3½ h.p. Two-speed P. and M., 84 × 86, 26 × 2¼in. rubber-studded Shamrock	Eisemann magneto Bosch mag.	13	Gold medal	Chain drive ; condition excellent.
41	H. H. Dommett	3½ h.p. Triumph, 84 × 86, 26 × 2¼in. Clincher	Bosch mag.	Nil	†Gold medal	Condition very good, belt fastener broke, belt changed, first Gloria, then Dermatine.
42	R. King	3½ h.p. Triumph, 84 × 86	Bosch mag.	Nil	Gold medal	Machine in very good condition, no replacements whatever.
43	J. Haslam	3½ h.p. Rex, 82 × 89, 26 × 2¼in. Continental	Bosch mag.	Nil	Gold medal	Machine in good condition, same belt (Gloria) and tyres throughout.
44	Capt. Sir R. K. Arbutnot, Bart., R.N.	3½ h.p. Triumph, 84 × 86, 26 × 2¼in. studded Clincher	Bosch mag.	Nil	Gold medal	Machine in excellent condition.
45	Rev. L. Cutler	3½ h.p. Triumph, 84 × 86, 26 × 2¼in. Clincher	Bosch mag.	All possible	Bronze medal	Endless inner tube troubles, exhaust valve changed, used two belts ; condition very good.
46	H. V. Ellison	1½ h.p. Motosacoche, 68 × 70, 26 × 1¾in. Clincher	Accumulator	Retired	—	Retired through tyre troubles.
47	J. V. Robinson	1½ h.p. Motosacoche, 68 × 70, 24 × 1¾in. P.U.	Accumulator	293	Bronze medal	Up till Saturday morning only lost three marks, last day locked free-wheel, broke crank, and took one off Clark's machine lying side of Wick Road, pushed up Wart Hill to John-o'-Groat's ; bicycle condition poor, engine excellent.
48	W. F. Merritt	3½ h.p. Triumph, 84 × 86, 26 × 2¼in. Shamrock back, Clincher front	Bosch mag.	Nil	Gold medal	Condition excellent, footrest bent, fork spring broke.
49	Dr. J. Ewing Adam ..	3½ h.p. Triumph, 84 × 86, 26 × 2¼in. Clincher back, Shamrock front	Bosch mag.	Nil	Gold medal	Condition very good, no engine troubles, machine new and rider practically novice, wet on magneto, bent footrests.
50	G. L. Fletcher	2 h.p. Twin Moto-Réve, 50 × 76, 26 × 2in. Continental	Gianoli mag.	All possible	Bronze medal	Frame trouble, ingeniously repaired broken back stay with engine spanners.
51	W. Smith	2 h.p. Twin Moto-Réve, 50 × 76, 26 × 2in. Shamrock	Gianoli mag.	Retired	—	Reported broke front forks.
52	C. A. Palmer	5 h.p. Two-speed Twin Roc, 75 × 76 26 × 2¼in. Dunlop	Bosch mag.	Nil	Gold medal	No engine replacements, used two belts, same tyres, front wheel loose ; condition very good.

† By being too early at controls.

† Joint Winner of Berriedale prize.

THE RESULTS OF THE END-TO-END AT A GLANCE (Continued).

No.	Rider.	Machine.	Ignition.	Marks Lost.	Result, Subject to Confirmation.	Remarks.
53	W. Newman	4 h.p. Two-speed Roc, 85 x 90, 26 x 2½ in. Continental back, 2½ in. front	Bosch mag.	Retired	—	Connecting rod ball bearing broke between Moffat and Stirling.
54	A. D. Powell	3½ h.p. Two-speed B.P., 80 x 80, 26 x 2½ in. Pullman back, Clincher front	Bosch mag.	Retired	—	Two-speed gear damaged by inserting odd-sized balls with grease
56	H. B. Lewis	3½ h.p. Triumph, 84 x 86, 26 x 2½ in. Shamrock	Bosch mag.	7	Gold medal	No replacements, footrests, and pedal bent, same belt (Gloria). front wheel bearing slack; condition very good.
57	A. M. Tatham	3½ h.p. Matchless-Jap, 85 x 76, 26 x 2½ in. Dunlop	Bosch mag.	Nil	Gold medal	Condition excellent.
59	P. Weatherhilt	3½ h.p. Zenette, 80 x 80, variable gear, 26 x 2½ in. Clincher	Accumulator	Retired	—	Short in coil on Grampian section.
60	F. W. Barnes	3½ h.p. Zenette, 85 x 80, 26 x 2½ in. Palmer ..	Bosch mag.	92	Silver medal	Leather belt troubles through want of dressing overnight, pulleys much worn, footrest bent, carburetter bracket broken; machine condition excellent.
61	A. F. Wilding	6 h.p. Twin Bat-Jap, 70 x 95, 26 x 2½ in. Shamrock, 2½ in. back	Bosch mag.	Nil	Gold medal	Excellent condition.
62	A. D. E. Craig	5 h.p. Four-cylinder F.N., 50 x 56	Bosch mag.	All possible	Bronze medal	Water on magneto, choked carburetter, lost compression, back mud-guard detached; machine in good condition. All marks lost during bad weather on Fitlochry run.
63	H. D. Seale	3½ h.p. Triumph, 84 x 86, 26 x 2½ in. Shamrock back, Clincher front	Bosch mag.	Nil	Gold medal	Condition excellent; machine purchased out of stock at cycle shop
64	H. R. Dougal	1907 5 h.p. Twin Vindec, 75 x 76, 26 x 2½ in. Michelin	Bosch mag.	Nil	Gold medal	No trouble with engine or tyres.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(Continued from page 532)

LOST DRAIN TAPS.

243. When knocking, loss of power, or apparent overheating set in suddenly on the road, always ascertain that the draintap of the crankcase is in position and closed, as loss of oil will cause any of the above symptoms in a very aggravated form, and the engine bearings will speedily be ruined if a wood plug is not promptly inserted, and several charges of oil injected.

LOST NUTS.

243. If thread is fairly coarse, the place of a nut may be taken by binding thread tightly with copper wire. I have even retained an engine pulley on its shaft by this means.

LOST PULLEY KEY.

244. If shaft be tapered, a hard wooden key will hold for many miles if the locknut be well tightened.

LOSS OF POWER.

245. Usually means each tiny adjustment is a little out, and that the

- (a.) Bad compression.
- (b.) Wrong timing of valves and ignition.
- (c.) Bad oil or under-lubrication.
- (d.) Dirty cylinder and piston, sticky piston rings.
- (e.) Wrong lift to either valve.
- (f.) Dirty radiators.
- (g.) Partially choked petrol pipe or carburetter.
- (h.) Dirty carburetter gauzes.
- (i.) Dirty electrical connections, especially bad earth at contact breaker.
- (j.) Overheating (see previous paragraphs.)
- (k.) Valve tight in guide.
- (l.) Cylinders not synchronised.
- (m.) Choked silencer.
- (n.) Crack in exhaust valve seating.
- (o.) Worn bearings, tappets, cams.
- (p.) Chains out of pitch or truth.
- (q.) Wheel bearings too tight and under-lubricated.
- (r.) Bad mixture.
- (s.) Brakes binding.
- (t.) Bad petrol.
- (u.) Bad coil.

- (w.) Leaky sparking plug.
- (x.) Maladjustment of contacts, or use of spurious metal for platinum.
- (y.) Piston ring slots in line.
- (z.) Plug points too far apart.

MISFIRES.

246. 1. MISFIRES OCCURRING AT ALL ROAD AND ENGINE SPEEDS PERSISTENTLY.

- Cracked or broken sparking plug.
 - Batteries running down.
 - Loose or dirty connection.
 - Tumbler in need of adjustment.
 - Water in the petrol.
 - Dirt in the carburetter.
 - Magneto wants cleaning.
- (To be continued.)

The Continental Motor Co., 32, Rosebery Avenue, E.C., informs us that it has decided to market Clincher A Won extra heavy and reinforced Peter Union covers, fitted with either Goodrich or Shamrock Excelsior rubber studded bands. These extra treads, we understand, will be properly vul-

We are asked by the City Ignition Co., 14, Spencer Street, Goswell Road, London, E.C., to point out that their Voltcoo showcards can be supplied to dealers in and manufacturers of motor cycles and accessories.

A telegram from W. H. Wells to the Michelin Tyre Co. reads as follows: "John o'-Groats at last. Perfect score. Never touched a pump to Michelin tyres or had a side-slip on worst roads imaginable.—Wells."

Riders of Rex machines will be interested to learn that the Rex Motor Mfg. Co., Ltd., Coventry, are now making an adjustable pulley specially designed to suit their machines.

With reference to the article published recently regarding the new pattern Laurin and Klement motor cycles, Messrs. Laurin and Klement Motors, of 255, Tottenham Court Road, W., ask us to point out that they have in all six models of motor cycles all built to the design of the two models we illustrated. The sizes are 2½ h.p., 3 h.p., and 4 h.p. single-cylinder and

THEY DON'T SKID.

This is the Tread taking the Drive and Wear.

This is the Non-Skid ready to come into action if needed.

20 years' experience is behind this tyre.

This is one of many testimonials we have received.

London, June 19th, 1908.

Dear Sirs,—Just a line to tell you how delighted I am with your **Three Spires Non-Skid Tyre**. I have now covered several thousand miles in all weathers and daily running, and it suits me down to the ground, needless to say it has not punctured. I was delighted to note the quality of the rubber employed and wonder you can do it for the price, also how soft and easy is the cover to get on the rim. I need hardly say that I shall insist on **Three Spires** in the future.

By the way what grand tubes you make, I have seen nothing so good.

Wishing you every success, as you deserve,

Yours faithfully, H. W.

May we send you prices and particulars. Special offer to Readers of "The Motor Cycle."

THE COVENTRY RUBBER CO., COVENTRY.

A MOTOR CYCLE
WEIGHING
ONLY 60 LBS.

A PERFECT
MOTOR CYCLE AT
A BICYCLE PRICE.
£19 19 0 complete.
Fitted with Ruthardt
Magneto
£4 10 0 extra.

THIS IS QUITE THE LOWEST PRICE

at which it is possible to obtain an efficient motor cycle. The "Wolf" featherweight motor cycle is no toy—it is a marvel of sound construction and ingenuity, and with a wonderful hill-climbing capacity. The frame is specially built and the whole machine is British made.

THE "WOLF" FEATHERWEIGHT MOTOR CYCLE.

SPECIFICATION.

ENGINE—A. J. Stevens 2½ h.p.; bore 2½ in., stroke 2½ in.
COIL—Fuller.
ACCUMULATOR—Premier.
CARBURETTER—A. J. Stevens' automatic air inlet and throttle combined.
BELT—Best Chrome.
JOCKEY PULLEY—Ball Bearing.
FRAME—22 in. and 24 in.
TANK—To which combined petrol, lubricating oil, and coil compartments are fitted.

WHEELS—26 in. or 28 in.
TYRE—Wasp No. 1, 1½ in. diameter. Made specially by the Dunlop Rubber Co., Ltd.
CONTROLS—Valve lifter and ignition are controlled by one lever; when magneto, extra lever for ignition.
HANDLEBAR—Wide raised, to which a switch of neat design is fitted.
BRAKES—Wasp front and back roller or inverted levers.
FINISH—Best black enamel, lined two colours. Olive green, silver lines 10/- extra.

"Wolf" Tyres made by the Dunlop Rubber Co. Ltd., 2 in. to fit any standard 1½ in. rim 20/- extra. Write for lists.

WEARWELL MOTOR CARRIAGE CO., LTD., WOLVERHAMPTON.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.

York and Lancashire.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northamptonshire, Warwickshire.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.

Worcestershire, Herefordshire, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

SECTION X.

Scotland.

SECTION XI.

Ireland and Isle of Man.

NOT TOO LATE

even now to obtain exactly what you want in either new or second-hand mounts for the **AUGUST HOLIDAY**. Liberal terms of exchange arranged at once. All machines, new and second-hand, sent out ready for the road.

The following machines, and others, are all in our Showrooms:

NEW MODELS.

TRIUMPH 3½ h.p., 1908, magneto	£48 0
WARWICK, shop-soiled only	46 0
TRIUMPH 3½ h.p., 1907, magneto	39 0
N.S.U. 3½ h.p., 1908, magneto, new, 26" wheels	40 0
N.S.U. 3½ h.p., magneto, new, 1908, 24" wheels	40 0
N.S.U. 3½ h.p., 1908, twin, magneto, 24" wheels	45 0
N.S.U. 6 h.p., 1908, twin, magneto	54 0
N.S.U. 1½ h.p., 1908 lightweight, magneto	34 0
REX DE LUXE 3½ h.p., 1908, magneto, two-speed gear	50 0

Also various other new models, Motosacoche, F.N., Roc, Vindec, Warwick, etc., all in stock.

SOILED AND SECOND-HAND

N.S.U. 3½ h.p., 1908, accumulator, shop-soiled, cost £36	£28 0
G.B. ZEDEL 5-6 h.p., 1908, engine magneto, two-speed, spring forks, fan, footrests, perfect, cost over £70, will accept	35 0
TWIN ROC 5 h.p., Peugeot engine, magneto, free-engine	30 0
ROC 4 h.p., 1907, magneto, free-engine, Druid spring forks	25 0
ROC 3½ h.p., magneto, clutch, good running order	12 6
N.S.U. 3½ h.p., 1907, magneto, new Roc two-speed gear, spring forks	30 0
N.S.U. 6 h.p., 1908, new May, Roc clutch, improved gear, cost £75	55 0
REX TWIN TOURIST, magneto, '08, as new JAP, 6 h.p., magneto, '08, Chater Lea frame, not run	27 0
VINDEC SPECIAL 3½ h.p., magneto, Truffault spring forks	26 0
NOBLE, 3 h.p., long wheelbase, good order	12 0
WHITLEY 3½ h.p., spray carburettor	8 10
JAP, 6 h.p., Twin, Chater Lea frame, grand condition	20 0
KERRY 5 h.p., twin, two-speed, hand-starting	20 0
ANTOINE 4 h.p., low frame, free-engine	15 0
WERNER, twin, 4 h.p., recently overhauled and refinished	16 0
N.S.U. 5½ h.p., magneto, overhauled	25 0
ROVER, 3 h.p., Palmer tyres, Broo saddle, running well	10 10
REX 3½ h.p., John-o'-Groat's model	10 0

Others constantly arriving.

Let us give you details of the

WARWICK CAR-STYLE MOTOR CYCLE.

Hand-starting, ball bearing 4 h.p. engine, Bosch magneto, spring forks, Roc (licensed) clutch, epicyclic two-speed gear, started and driven like a car; several reasons in advance of ordinary motor cycle design.

Price 45 guineas.

PREMIER MOTOR AGENCY,

Aston Road, BIRMINGHAM.
Telephone: 4310. Telegrams: "Primus," B'ham.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, to the number given, c/o "The Motor Cycle," Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties advised of this receipt, and upon intimation of arrival and acceptance of the goods, the money forwarded less a charge of 1s. for registration. Time allowed for a decision after receipt of the goods three days. For all transactions exceeding £10 value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques money orders should be made payable to Iliffe Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive answer to their enquiries are requested to regard silence as an indication that the goods advertised have already been disposed of. Advertisers often receive many enquiries that it is quite impossible to reply each one by post.

All letters relating to advertisements must be distinctly under what heading they appeared, and of issue.

MOTOR BICYCLES FOR SALE

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

5-6 h.p. Twin Berceley, built June, 1908, in splendid condition, Chater-Lea through out, spare tube and belt; £20, no offers. Edward Irving, 13, Lowther Street, Penrith.

DERMATINE BELTS

HOLD ALL RECORDS.

End-to-End Record, June 9th and 10th :

Mr. A.W. Bentley, using **Dermatine belt**.
M.C.C. 24 Hours' Ride to Edinburgh,
June 5th and 6th :

35 were successful, using **Dermatine belts**.

Stadium Race Meeting, June 8th :

Harry Martin, **First** in Ten Miles Race.

Stadium Race Meeting, June 24th :

Again the **first, Second, and Third** winners

were fitted with **Dermatine belts**.

No other belt holds such records. The Original Rubber and Canvas Belt. **BEWARE OF IMITATIONS.** The standard belt that is adopted by all leading manufacturers.

End-to-End Record.

Read the testimonial from the **Triumph Co.**

Coventry, June 22nd, 1908.

Mr. Stanley Webb, 32, London Road,

Bromley, Kent.

Dear Sir,—I do not know whether we have written to you about the Bentley End-to-End record. Mr. Bentley had a Stanley Dermatine Belt fitted to his motor cycle. It gave him entire satisfaction, and had not to be touched once during the whole ride of 886 miles.

Yours faithfully, M. J. SCHULTE,
Manager Director, Triumph Motor Co., Ltd.

Second season in use, and still going strong.
125, Bunhill Row, E.C., 12/6/08.

Dear Sir,—You will be pleased to hear that the "Dermatine" Belt I used in this year's London-Edinburgh run gave me no trouble whatever, and that, moreover, it was the identical belt I used in last year's L.-E. run. It is still going strong, though having run nearly 3,000 miles. Yours faithfully, J. P. LE GRAND.

800 miles, and no trouble nor once shortened.

Southernhay, Loughton, June 12th, 1908.

Dear Sir,—I must again congratulate you upon your excellent belts, as the one I used on my 3½ Vindec in the Schulte Cup Competition to Edinboro' and back gave me no trouble whatever, and was not even shortened once in 800 miles. I consider this a severe test, and a splendid proof of efficiency.

Yours faithfully, OWEN L. SUMMERS.

Hundreds of Testimonials. British Made.

CARS FOR SALE.

- 6** h.p. De Dion-Populaire, genuine licensed car, two speeds; £65.—Below.
- 8** h.p. M.M.C., tonneau, single-cylinder, three speeds, reverse, new tyres; £39.—Below.
- 15** h.p. Darracq, tonneau, four-cylinder, 1905, three speeds, direct top; £120.—Below.
- 16-20** h.p. Corre, tonneau, four-cylinder, similar car to Renault, nearly new; £110.—Below.
- 16-20** h.p. Winton, 1907, side entrance, four-cylinder vertical engine, H.T. magneto, Cape hood; £100.—Below.

MUIR screw-cutting and surfacing lathe, 6in. centres, complete, as new; £14 10s.—L. N. Palmer, 190, Mellison Road, Tooting.

10 h.p. Automoto, back entrance, seats five, running order; £45, or exchange.—39, Hillfield Park, Muswell Hill, N.

14-16 h.p. Daimler, four-cylinder, tonneau, gate change, silent, excellent order; £85.—Below.

24 h.p. Mutel, four-cylinder, M.O.V., Roi des Belges tonneau, pressed steel frame, perfect order; £100.—Below.

10-12 h.p. Durkopp, two-cylinder, detachable tonneau, perfect order; £45.—Tickner.

12 h.p. Morris, two-cylinder, tonneau, three speeds, enclosed radiator; £32 10s.—Tickner, 255, Earlsfield Road, Wandsworth.

THREE-WHEELER Runabout, brand new, amateur made; £28 cash.—Particulars, etc., Altree, 331, Dudley Road, Wolverhampton.

ROVER Car, 6 h.p., just overhauled by company, and guaranteed perfect; £80, Triumph part payment.—Parker, Melbourne, Derby.

DE DION-DENNIS, 8 h.p., perfect order, detachable tonneau; trial; £50; appointment.—Stevens, 22, Mitcham Lane, Streatham.

BABY Peugeot, three speeds and reverse, new gears, tubes, and front tyres, dust screen and accessories; expert examination; £48.—18, Collingdon Street, Luton.

5 h.p. Oldsmobile, two or four-seater, spares, etc.; £35, or exchange for tri-car, or motor bike and little cash.—435, The Motor Cycle Offices, Coventry.

DARRACQ, 20 h.p., four-cylinder, thoroughly overhauled, and new 105 rear tyres and tubes, all spares, including four covers and three tubes, guaranteed to do 30 miles per hour; £120 cash, or exchange; trial run willingly, or will hire out.—Maude's, Powell Street, Halifax.

9-11 h.p. Two-cylinder Clement, in excellent running order, Rothschild tonneau body, in good condition, seats four, recently overhauled and new gears, and Lacoste commutator, etc., fitted, driven daily by owner; must be sold; cash wanted; trial given.—"Motor," 1, Netherfield Road, North Finchley.

ROVER Cars. — The 6 h.p. single-cylinder two-seater Rover is the best low-priced car on the market. It is fast, silent, exceptionally reliable, and far more comfortable to ride and drive than tricars or motor cycles. We will take these in part exchange, or supply on deferred payments. — Louis Davis and Son, Moseley, Birmingham.

8 h.p., two-seater, Coronet engine, bucket seats, multiple disc clutch, three speeds and reverse, lamps, horn, and spares, very smart little car, painted grey, quite up-to-date; £42, or nearest offer, or would exchange with latest £60 N.S.U. motor cycle, for 9 h.p. Riley car, or Chenard-Walcker.—Roberts, 10, Grove Place, Hampstead, N.W.

LOST AND FOUND.

FOUND, near Ilkley, two air tubes, on the 11th July.—Apply, Albert Farnell, 50, Manningham Lane, Bradford.

BUSINESSES FOR SALE.

MOTOR and Cycle Business for sale, North of England, good agencies; going cheap.—Apply, Box 427, The Motor Cycle Offices, Coventry.

ACCUMULATORS.

NEW Premier Accumulators; to clear, 6d. each, or exchange.—Motor Exchange, Westgate, Halifax.

BRIGHTON Bargains.—Accumulators, from 5s.; some real bargains going; see for lists.—Johnstone's, Kensington Garden Brighton.

CELLULOID Accumulator Repair Outfit useful for all celluloid repairs; full directions; post free, 1s.—Osborne Works, Forest Hill, London.

VOLTOO Coils work on two volts, extremely economical and efficient; see for lists.—Ajax Electrical Engineering Co., 291, High Road, Ilford.

THE Famous Ajax Accumulator, absolutely the finest it is possible to make (see advertisement in Spring No. "Motor Cycle"); specially protected terminals; amp. size will run 2,000 miles with Volt coil.

20 Amp. Minerva, 10s.; 10 amp. Lithanor 7s. 6d.; 10 amp. Castle, 7s. 6d.; two amp. Sampson, 5 by 3½ by 3 inches, 12s. each; 40 amp. Bluemel, 18s. 6d.; 20 amp. B.B.L., 10s.; all clean and dry, ready for charging.—Lund and Davies, Heaton Lane, Stockport.

ACCUMULATORS Repaired promptly, and made; reasonable charges, best work estimates given; full value for your old accumulator in exchange for our new "Mayfair" accumulators; special 15 amp., 16d.; 20 amp., 15s.; guaranteed one year.—Fellows, 49, Hertford Street, Mayfair.

CONTACTS.

IRIDIUM "Champion" Contacts, any pair fitted; returned same day; 1s. 3d. each.

IRIDIUM "Champion" Contacts, warranted pure; trimmers for polishing iridium; 9d.; no filing required.

IRIDIUM "Champion" Contacts. — Williams, 16, Wellington Street, Woolwich. Pure platinum fitted, to order, from 1s.

JEBRON Contacts, registered, 291289, vastly superior to platinum; cures misfiring; is reliability and efficiency.

JEBRON, best contact obtainable; blades, screws, cranks, rockers, plungers, magnetos, coils.

JEBRON, prices 2s. 6d. each rivet fitted; special trimmers for polishing Jebro; 9d.; remittance with order ensures prompt attention; write for particulars and testimonials, too numerous to publish.

JEBRON Magneto Screws, complete, Bosch magneto, DA2, will fit contact breakers 5A, 5B, 5C, 5s. 9d. pair; old screws fitted with Jebro, 2s. 6d. each; everlasting wear, requiring no attention.

JEBRON, the King of Contacts, fitted to return post; no delay; post free home or abroad; liberal trade terms.

JEBRON.—From the Inventor, J. Edwin Brown, 38, Herbert Road, Plumstead, Kent.

COUPLINGS.

UNITO Cycle Couplings, for connecting any ordinary pedal cycle to motor cycle.

THE Unito connects the steering and ensures faultless alignment.

THE Unito is so constructed that strain and lean of machines is entirely obviated.

THE Unito is adjustable to accommodate differences in wheelbase and wheel frame dimensions.

DON'T Buy a Sidecar before you know the advantage of having a

UNITO Coupling. It only costs 1 guinea.—Write, Dept. B., Unito Coupling Co., Ystrad, Glam.

SET of Ariel Couplers, perfect condition, 15s.—Rev. Norris, Longton Vicarage, Preston.

ARIEL-LIBERTY Coupler, perfect; 25s.—Bulbrook, Glasgow, Church Road, Manor Park, E.

Some Experiments with Crank-case Compression.

By J. OKILL, M.I.A.E.

THE motor cyclist as a rule is a very keen observer of cause and effect with regard to his engine, be the effect ever so small, and in this connection the recent remarks by "Ixion" in the *The Motor Cycle* for May 13th on "the increase of power developed by engines when the pressure in crank case is released" form interesting reading, phenomena being, as "Ixion" says, worth experimental investigation.

The conditions cited under which increase in power is experienced are not quite similar. In the one case a clear opening was made in the crank case, and in the other four or five relief valves were fitted to the crank case.

Now, the conditions under which the least waste of engine power would take place would be with the crank case entirely removed, the moving parts of the engine being exposed, as in the ordinary open frame engine. This is, of course, an impracticable construction for a motor cycle engine. The next arrangement in order of efficiency would be to have the crank case made completely airtight. With this latter arrangement, when the piston descended the air contained in the crank case would be compressed to a few pounds per square inch above atmospheric pressure, the temperature of the air at this instant being somewhat above that of the atmosphere. On the up stroke the piston practically all the work of compression could be given back, except for slight transfer of heat to and from the atmosphere, and the arrangement would be a good one from the point of view of efficiency. If the crank case, piston, etc., were perfect non-

conductors of heat, the only energy wasted would be due to the eddying motion of the air contained in the crank case, set up by the moving parts of the engine. A perfectly air-tight crank case, besides being almost an impossibility, is not desirable. Trouble would be experienced by lubricating oil being forced out through the shaft bearings; further than this, it is always advisable to provide for the escape of any exploded or unexploded vapour that may have leaked past the piston into the crank case.

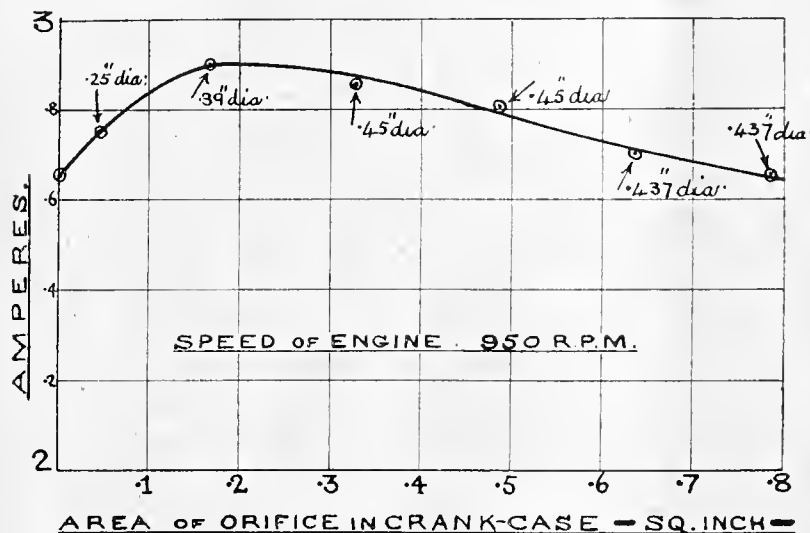

Pressure in the Crank Case.

As a rule, all engine crank cases are open to the atmosphere at some point, and air relief valves fitted to engines whose crank case volume varies with piston movement so as to cause compression. When an air valve is fitted, this latter opens on the downstroke of the piston, so that when the piston is at the bottom of its stroke, the pressure in the crank case will be atmospheric. If the air valve is tight, and there are no leakages, the pressure in the crank case at the end of the upstroke of the piston will be below that of the atmosphere, so that in this case the air valve will be of no further use. As a matter of fact, it is impossible to prevent air leakage past the shaft bearings, etc., into the crank case during the upstroke of the piston. The result is there is always some air passing through the air valve on the downstroke, and this is the condition of things we have in practice. Unless the leaks are great, one valve should be ample to allow of the escape of this air leakage.

In order to determine the actual effect on the power of the engine when a number of relief valves are fitted,

Some Experiments with Crank-case Compression.—

and also to determine the effect when a number of orifices are made in the crank case, the writer has made a series of experiments on a new $3\frac{1}{2}$ h.p. Fafnir engine. The most suitable method that suggested itself, so that accurate conclusions could be arrived at, was to drive the engine by means of an electric motor, measuring instruments being placed in the circuit so that the power taken to drive the engine under the various conditions could be accurately noted. As the engine was new, the bearings would be in good condition, air leakage thus being reduced to a minimum. The cylinder proper was open to the atmosphere, the inlet valve and its seating having been removed.

In all the experiments the engine was driven at a speed of 950 r.p.m. The first experiments were made with the crank case completely closed, no air vents being provided, air leakage being prevented as far as possible.

The current reading under these conditions was 2.65 amps. (this reading including the current necessary to drive a line of shafting from a pulley on which the engine was driven). Without stopping the engine, one air relief valve of light and sensitive construction was allowed to come into action, but no alteration in the ammeter reading was apparent. The introduction of a second and then a third air valve made no measurable difference in the power required, and as the relief valves were of large area, it is obvious that additional valves fitted to the crank case of an engine, while not detrimental, are at the same time unnecessary.

The second series of observations were made with

orifices in the crank case, the results being plotted the accompanying diagram.

The current reading with the crank case closed, before, was 2.65 amps. The first orifice opened was of .25in. diameter, the current reading rising to 2.9 amps. The second orifice of .39in. diameter gave current reading of 2.9 amps. On opening a third orifice of .45in. diameter, the current reading fell to 2.8 amps., while on opening a fourth orifice of .45in. diameter the current reading fell to 2.8 amps. On opening two more orifices of .437in. diameter the current required to drive the engine was exactly the same as with the crank case completely closed, i.e. 2.65 amps. As the combined areas of the orifices was .787 sq. in., and it was impossible to arrange further openings without mutilating the crank case, no further experiments were made, the results obtained being sufficiently definite to enable one to draw conclusions as to the utility of orifices.

Deductions from the Experiments.

The interesting feature about the second series of experiments is that they show a critical area orifice, or an area at which the power required to drive the engine is a maximum, being .077 h.p. above the power required with a closed crank case. The increase in power required with the first orifice open represents the work done against friction of the air passing through the orifice, and the extra eddy motion of the air in the crank case caused by opening the orifice. By opening the second orifice, in this case, the resistance becomes a maximum. The fall in current when a third orifice is opened is due to decreased air velocity, etc., through the orifices. This is still less when the remaining orifices are opened. Even with a total orifice area of .787 sq. inch, as before mentioned, the current required is the same as with the crank case completely closed fitted with a valve. The character of the curve, however, would seem to indicate that if the orifice area was increased above .787 sq. inch, there might be a gain in engine power, when compared with a closed crank case or one fitted with an air valve. The phenomenon that it takes more power to drive an engine with an orifice in the crank case than without is well known to those motorists who have experienced a parallel case, i.e., driven a two-cylinder engine with only one cylinder firing, the other cylinder simply compressing and expanding, in the one case with the sparking plug removed, and in the other with the plug in place.

SIDECARS AND WIND RESISTANCE.

One thing noticeable with sidecar attachments is the amount they are slowed when travelling against a wind. This is, of course, owing to the width of the sidecar and the amount of surface offering resistance to the wind. We made an interesting comparison the other day with a 1908 Triumph bicycle and Montgomery sidecar when travelling before and against a wind. The gear used was $4\frac{3}{4}$ to 1. On an outward run of seventy-two miles on Midland roads with the wind, passengers weighing nineteen stones, an average speed of twenty-four miles an hour was maintained, and the petrol consumption was only three quarts, equalling nearly one hundred miles to the gallon. On the return run against the wind the average speed worked out at eighteen miles per hour,

and the consumption of petrol nearly five quarts. On the occasion of this run, we may mention, we had the first opportunity of trying the Montgomery sidecar over several miles of really muddy roads, and we were most favourably impressed by its stability.

We have received copies of *La Voiturette*—a French journal published fortnightly, dealing particularly, its title indicates, with small cars. The majority of the paper is printed in the French language, but it has an English section. The offices of the journal are situated at 78, Rue Charles Laffitte, Neuilly, Paris, and the editor is M. Georges Dupuy. In view of the great interest evoked by the Grand Prix des Voiturettes, this journal should be of interest to British readers.

More about the Lightweight.

SO much interest seems to have been aroused by the lady's lightweight that possibly a few further details as to its capabilities may prove welcome to readers. A good many of my own sex are undecided about taking the plunge and entering the ranks of motor cyclists. They need hesitate no longer, for a machine weighing only 80 lbs. removes most of the drawbacks hitherto attendant on the pastime. If you tell people what can be done even with an engine of $1\frac{1}{4}$ h.p., they say, "Oh, that's very well in the hands of a professional, who can pedal for all he is worth. I am only an amateur." Precisely. So am I, and past my first youth at that. For long I had cherished a secret ambition to do a record ride (for me) on my Motosacoche, built by the Clyde Co., of Leicester. The cook was away, the mechanic was away, the groom was away, and last, but not least, my husband was away. I was free as air. No bothering meals to think of, order, and preside over. Now or never was my chance. I am a firm believer in reparations, which save many a delay on the road. I made mine in the previous afternoon—took out and cleaned the plug, saw to the points on the magneto, cleaned the terminal, oiled every bearing, including the free-wheel and the two-speed pedalling gear, pumped up the tyres, filled tanks with oil and petrol, and poured some of little Miss Motosacoche's special lubricant into a medicine bottle, which I proposed to carry with me, for the dainty dame has a special fancy for Price's Motorine C.

Up with the Lark.

The next day I rose at twenty past four, dressed, and had a slice of bread and butter and a glass of milk placed in my room overnight. My driving licence? Yes. Knife, indelible pencil, and spare rag in my left pocket. Nothing was forgotten. I crept out of the house, unlocking the back door, and repaired to the motor house, expecting to make an immediate start. But little delays arise in an extraordinary manner. My front tyre had run down a bit during the night. I pumped it up. Then the compression of that little $1\frac{1}{4}$ h.p. engine was something phenomenal. I could not pedal fast enough to start it. Paraffin, of course, I gave a liberal supply through the compression tap; but I had to renew the operation six times before the engine would turn freely. Then it buzzed away, and I set the carburetter to all air. After that came a tussle with Price's stand. One leg was easy enough to manipulate, but the other stuck, and proved extremely awkward. After that I had to clean my hands and refill my little can with paraffin. However, a quarter past six saw me make a start. The morning was glorious, and, although I carried a cape, for once in this island clime the day looked like being fine. Past Kibworth and Glenn I

bowled, and at Oadby turned up a hilly, stony lane, which avoided the Leicester traffic and brought me out clear of the town by Thurmaston. Although a mile or two longer, this route cheats the trams. Once clear of the villages, I was able to travel at a good pace, and, reaching Melton, went straight through to Grantham. On this portion of the road there are some severe hills. My little machine took all save one without a stroke of the pedals, and then the belt started to slip. I profited by the presence of a steam roller to dismount and tighten it, and, not halting at Grantham, rode straight on to Newark-on-Trent. Here I took in sixpennyworth of petrol.

Starting Quite Easy.

Between Newark and Tuxford I found the gates of three level crossings closed against me. This caused delay, and also a dismount and remount on each occasion. Fortunately, starting did not possess any terrors, as in the olden days. Slipping in the low speed pedalling gear, I could get off again with ease. Four hours and eight minutes from the start saw me at Tuxford, a distance of seventy-five miles, if not a trifle more. At 10.30 I sat down to lunch, for I was ravenous. After that meal I took a stroll, my limbs being somewhat stiff from sitting so long in the same posture, and then looked round my good little bicycle, oiling it all over, and tightening the belt. At twelve I started for home, and, stopping at Newark, bought sixpennyworth more petrol, so as to run no risks. My tank holds five pints, and on this I can go from eighty to ninety miles. From Newark to Harborough I made a non-stop run, and did the entire return journey in 3h. 45m. I had

The writer with her Motosacoche, built by the Clyde Co.

achieved my object of doing 150 miles in the day, and might have done another 50 had I been so inclined. But I had done enough to show what a lightweight, low-powered machine is capable of in the hands of an amateur lady. What little may be lost in actual speed is gained in handiness and convenience and ease of manipulation. On my former bicycles that weighed about 180 lbs., each time I dismounted I quaked as to how I was going to get on again, and had to beg passing cyclists and drovers to give me a push. On this journey I was completely independent. I could get off when I chose and mount when I chose. Neither did I feel any nervousness at going so far from home entirely alone. With money in my pocket in the event of trouble I had only to unhook the belt and pedal to the nearest station or town, precisely as one might do on an ordinary bicycle.

In Praise of the Lightweight.

The Motosacoche engine is a marvel. It will take one almost anywhere. Of course, it cannot compare

More About the Lightweights.—

with a speed monster, and for long and serious touring possibly a 3 h.p. or 4 h.p. with two-speed gear might be preferable. But what the great bulk of lady riders want is a mount simple, light, easy to manage, that will not strand them on the road or tax their strength to the point of utter exhaustion. Such a bicycle is now to be had, and one that answers all reasonable requirements. If I have demonstrated that it is no toy, but a mount to be relied upon to carry its rider anywhere in reason, and can persuade others of my own sex to take up the delightful pastime of motor

cycling, I shall be indeed well pleased. In conclusion, the petrol for 150 miles works out at 1s. 6d.—9d. for the petrol in the tank at starting and 1s. paid on the road. There remains enough to go quite thirty miles, which reduces the sum to 1s. 6d. Put down 6d. for oil and 1s. for depreciation—total 3s. What other conveyance is there can take you a 150 miles at such a price, and at the same time confer so much pleasure and interest? Hurry up, ladies, hurry up! Time is fleeting, and you are missing one of the best joys in life whilst you hesitate and procrastinate, so hesitate no longer. MRS. EDWARD KENNARD.

OCCASIONAL COMMENTS.

By "IXION."

Magneto Bell Crank.

Two riders have remarked to me upon the wear in the ball end of the bell crank on magneto contact breakers, of which I wrote recently. Mr. W. A. Jacobs says he remedies it by bending the crank with a slight outward "set," as to bring the ball end nearer the fibre ring. This has proved efficacious when wear had gone so far as to prevent the points breaking at all. Mr. B. H. Davies says it is very kind of me glibly to advise riders to buy a new part, but there is such a wide variation in the exact shape and dimensions of these cranks as manufactured in different years that a new and unworn part may make matters worse. This warning led me to sort out my own assortment, and I find I possess five, all slightly varying in either size or shape. I had a curious confirmation of this only last week. A machine I had carefully tuned up was running badly, and a fierce hill loomed ahead. I was in a hurry, so I hastily took off my contact breaker and put in an unused spare. The engine refused to fire at all, simply because the new bell crank was a different shape, and prevented a break at the platina. Mr. Davies says he tried two spares of his own a little time ago and two more that he borrowed, and that originally fitted to the machine was the only one of the five on which the engine would fire until he began bending them about.

Spare Belt Carriers.

I suppose most riders carry an extra belt when touring. In most cases the extra belt is a leather one, and that on the pulleys a rubber one. The leather belt, tied anyhow to the sides of the carrier, starts well greased, to preserve the nature of the leather. The rider leaves home on a fine day, and wind and suction deposit a nice layer of dust on the sides of the belt. Then it begins to rain. Finally, the rubber belt starts slipping or breaks. But, alack and alas, by now the leather belt is in such a messy condition that it requires half an hour's preparation before it is fit to put on the pulleys.

There are two sound methods of carrying a spare leather belt. One is to curl it up, lay it on a square of waterproof or American cloth, fold the corners over it, and lay it flat on the carrier to be strapped on beneath the bag. But this untidy method will offend the owner of one of those swagger pigskin kitbags with brass locks. He may care to copy a belt carrier I saw last week. It consisted of two light discs of wood about 10 in. in diameter, mounted on a spindle, so as to

form a bobbin. Three light clips held one disc to the carrier stays rigidly, and the whole was painted French grey. The belt hook was hitched to the central spindle, and the belt was then wound tightly round the spindle between the discs. When wound up, the top layer of the belt lay about half an inch below the edges of the discs. A strap, the width of which exactly coincided with the distance between the two discs, was then buckled tightly round the belt, and so for the expenditure of a little time and a few pence the proud owner had acquired a light, inexpensive, and efficient belt box.

Front Forks without Girders.

The fracture of a couple of pairs of front forks in the End-to-end confirms an old assertion of mine that to ride a motor cycle without girdered forks is courting an early death. The unfortunate riders in the trial escaped with a few cuts and bruises, but a friend of mine was killed on the spot some years ago through such a fracture, and we all remember how a keen clerical motor cyclist met his death in the same way. When Mr. Oakley was killed, a friend of mine took a first-grade pedal cycle, which he had ridden for eight years, to have its forks tested, and they snapped in half under a cross strain of a very few pounds indeed, proving that his precaution had averted a very nasty accident. I feel a very real anxiety about the number of light machines now running with untrussed forks. You can put a steel or wooden liner up the steering head, but that does not strengthen the forks in any way, and I for one would not ride a pair of single forks for more than a single season. It is a thousand pities those forks collapsed in the trial, as the previous performances of the two machines concerned had been simply superb, both up hill and down dale, but if manufacturers learn the appropriate lesson, our deep regret will be somewhat lessened, though our sympathy with the victims remains unimpaired. Crystallisation of the metal is set up within a few years on the much slower pedal cycle. On a motor bicycle, however light and slow, it is sheer folly to expect single forks to remain safe after one season, and new forks, or the addition of trussed girders, are the smallest precaution prudence can take. If it were ever my melancholy task to sit on a jury in such a fatality, I suppose my sympathetic verdict would be "Accidental death." But in strict honesty, if the victim were the manufacturer, the verdict should be "Suicide"; and if a customer, the verdict should be one of manslaughter against the manufacture of the machine.

The Eisemann Self-contained Magneto.

ONE of the first high-tension magnetos to be successful on a motor cycle was the Eisemann, which made its appearance in England as early as 1902. It became much better known in this country when the N.S.U. motor bicycles became more widely used. In the meantime,

Fig. 1.—The complete magneto

Messrs. Eisemann have not remained idle. They perfected their magneto with a separate coil, and, having done that, they have now designed a self-contained magneto, which is sold by the company's sole agents in this country, the United Motor Industries, 15, Poland Street, W., and Coventry. The magneto in question is a splendid example of workmanship; it is simple, most accessible, and very highly efficient.

Fig. 1 shows the complete magneto; fig. 3 shows the armature casing, together with the pole pieces A and the ball race C; fig. 4 shows the contact breaker. In the case of this par-

Fig. 3.

Armature casing showing pole pieces A, carbon brush B, and ball race C.

Fig. 4.—Contact breaker.

- D. Fibre ring.
- E. Rocking arm carrying platinum point.
- F. Earth connection.
- G. Condenser connection.

icular magneto the cam D working the rocking arm E is of fibre. The platinum points are of substantial proportions, easily attached and adjusted, while the plate to which the contact breaker is fixed is held in

position by a stud at its back fitting into a recess on the carrier, with the result that when the cover is removed the whole of the contact breaker mechanism except the cam can be lifted away.

The H.T. Terminal.

- A. Eyelet with spring ball connection G.
- B. Vulcanite tube lined with threaded brass tube having a drilled portion C.
- D. Small screw with circular end through which wire passes and is splayed out as C and held by D.
- F. Insulation.

The spring connection G makes contact with the condenser, and the copper terminal F makes contact with the carbon brush connected to the earth terminal, to which the switch is attached. Turning to fig. 5, we see the armature H showing the collector ring I, the ball bearing J, and the end of the spindle carrying the sprocket or gear wheel which runs in a plain bearing. The right-hand picture shows the end plate fitted to the magneto, the high-tension terminal L, the carbon brush M which makes contact with the collector ring L (shown in the illustration below), and the lubricator wick N, which delivers the oil to the plain bearing above referred to. This end plate is hollow, and forms an oil reservoir, the oil being conveyed by capillary attraction through the wick N. The safety spark gap O is also clearly shown. The left-hand illustration depicts the contact breaker cover Q, which contains the condenser. This magneto is particularly efficient at low speeds, and produces an exceedingly hot spark. The whole magneto is a production worthy of Messrs. Eisemann.

Questions & Replies.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied with a stamped addressed envelope for reply.

Air Adapter of Carburettor Loose.

? My engine, a $3\frac{1}{2}$ h.p. 1907 model Rex, overheats. The carburettor is Longuemare pattern, the choke tube of which is supplied in various sizes. This air adapter funnel merely stands over the airholes; it is not fixed in anyway, and is therefore free to jump up and down. The question is, would this movement of the adapter affect the mixture and so contribute to overheating?—B.A.H.

If the adapter is allowed any movement it will naturally upset the mixture to a large extent, but would not cause overheating unless the engine misfires. The adapter should be packed in firmly with the aid of a thin metal washer.

Detachable Air Tubes.

Q. I am riding a 5 h.p. Peugeot motor bicycle, and at present am using ordinary endless inner tubes. For convenience in puncture troubles I should like a detachable tube. Would you advise the change, and if so, what make would be most suitable?—A.B.

Detachable tubes are quite satisfactory, and very handy in case of a puncture or burst tyre, as it is unnecessary to take the back wheel out to replace a tube. The Rich and the Hermetic are the best known detachable tubes with a continuous air current. The makers of the former are the Rich Detachable Air Tube Co., Crawley, Sussex, and the latter the Self-sealing Rubber Co., Ltd., Ryland Street, Birmingham.

Fitting a Sidecar Attachment.

? I have a .6 h.p. Bat with J.A.P. engine, 3 to 1 gear. (1.) I propose, if possible, to fix a sidecar. What gear would you recommend me to use? (2.) Is it possible to fix a sidecar to a spring frame like the Bat has, and which type do you advise, rigid or flexible? (3.) Is it possible to fit Palmer cord tyres to my present standard rims?—J.R., Thornton Heath.

(1.) About $4\frac{1}{2}$ to 1 and a two-speed gear if you can manage it. (2.) Yes, a Bat spring frame would make no difference. Whether you fit a rigid or flexible sidecar depends on your own preference. Both are good, and have their advantages. If possible, try and obtain a trial with each pattern. (3.) No, the tyres in question will not fit your rims.

The Speed of Motor Cycle Engines.

? About 1,800 r.p.m. is often stated as the engine speed of a $3\frac{1}{2}$ h.p. engine. Does that mean 1,800 is the maximum number of revolutions that engine is capable of, or is this only what is called the normal number? When is an engine running at its normal number of r.p.m.? Also how can the maximum number of r.p.m. be obtained, and would it be safe and would the efficiency of an engine be increased if used at its maximum r.p.m. to aid in a hill-climb?—ANXIOUS.

1,800 r.p.m. is about the average number of revolutions at which the engine develops $3\frac{1}{2}$ h.p. It is often capable of acceleration up to 2,000 or 2,500, when it may for a short time develop as much as $4\frac{1}{2}$ h.p. An engine generally runs at its normal number of revolutions on a level road with the wind behind, spark well advanced, and throttle not quite half open. The maximum number of revolutions is, of course, obtained by opening the throttle to its fullest extent. The way to obtain the maximum revolutions of the engine is to see that everything is in order, and get the correct gear for the particular hill that you wish to climb, keeping the engine speed high.

Tricar Transmission.

? My tricar has a $\frac{7}{8}$ in. belt, and it does not last any length of time. Would it be advisable to fit a chain?—E.L., Skipton. The alteration to chain transmission will be expensive. Try a $1\frac{1}{8}$ in. belt, and fit an adjustable pulley and wider belt rim.

Pitting of Contact Points.

? I am riding a 7 h.p. Peugeot, and find same very destructive with the platinum points of contact breaker. When contact is broken the spark is not a mere bluish flame, such as I have seen on other motors I have possessed, but a most vicious spark, which at times might almost be described as a firework. I have quite recently had new platinum points fitted to blades at a cost of 10s. 6d., and they are already much pitted and burnt away. Do you think this is due to the coil (which is a plain one)? and if so, what remedy would you suggest?—H.J., Nottingham.

If the points are of genuine platinum or iridium, the trouble is due to the coil, the condenser of which is not working properly. If you continue to use a coil you had better buy the best that money can procure. A first-class coil should enable the platins to last 1,000 miles without adjustment.

End-to-end Trials. Another view of the last bend on Berriedale. M. W. Randle's 10 h.p. Lagonda disappearing from view.

Note correct position of canvas core eliminating the faults of the cheap-class belt.

"I have noticed articles from time to time in *The Motor Cycle* as to the relative merits of leather and rubber belts, and several assertions that rubber belts are useless in wet weather on account of their slipping. As a user of rubber belts for the past two years on a high-powered machine, I can honestly say that I have never had the slightest delay in wet weather from a good rubber belt slipping. In the recent Land's End to John-o'-Groat's Reliability Trial, where there was an almost continued succession of rain and muddy roads, I used one Shamrock Gloria belt from beginning to end, and never had any trouble with the belt slipping, and I only took half an inch out of the belt in the entire journey. Although running continuously in mud and slush, the belt at the finish was as good as when I started out. Now certainly if anyone wants more than this they are very hard to please. I can only think that dissatisfied users of rubber belts have pulleys and belt rims fitted on their machines which are not of the correct angle or in line with each other.

"Yours truly, W. H. WELLS."

"I am very glad to say that the S.G. belt gave perfect satisfaction during the very severe conditions that were experienced. I would point out that its chief merit was that it was only a 3/4 in. on a 5 h.p. machine. You can understand that owing to the conditions mentioned the belt came in for some exceptionally bad treatment, all of which it stood without calling for attention. I might mention that since above unfair treatment, the same belt has covered 700 miles, and yet shows very little signs of wear.

"Yours faithfully, ARCHIBALD J. SPROSTON."

"I have much pleasure in informing you that while using your Shamrock Gloria rubber belting on my N.S.U. motor cycle in the recent A.C.U. End-to-end Trials, I gained a gold medal with the loss of no marks. The belt gave me the greatest satisfaction, and is without doubt the best belt used for the purpose.

"Yours faithfully, S. W. CARTY."

The predominance of SHAMROCK-GLORIAS in all long distance runs is remarkable.

No doubt the S.G. Belt is again the most successful belt of the year.

Also 26in. by 1 1/4 in. for Lightweights.

Bands fitted to 26in. covers.

"I have much pleasure in informing you that I completed the End-to-end Trials on my 6 h.p. N.S.U. without losing a single mark, and gaining a gold medal. The Shamrock Excelsior studded tyre, which was fitted to my back wheel, was a perfect boon. There was not a sign of sideslip, even on the worst of roads, neither did I have a single puncture in the back wheel the whole run. The Shamrock Gloria belt was only shortened once, and did not give a moment's trouble, which speaks volumes for the quality of the same, taking into consideration that I was riding a 6 h.p. machine.

"Yours faithfully, M. GEIGER."

"I am pleased to inform you that in the Land's End to John-o'-Groat's Trial I got through without losing a single mark. I used one of your belts, a 3/4 in. Shamrock Gloria, also I had one of your Shamrock Excelsior covers on my back wheel, which withstood the bad roads splendidly. I had not a single puncture, and have great pleasure in congratulating you on having such a splendid tyre. I might mention that I have used your belts for racing purposes as well as for touring for a considerable time. I also came home by road 550 miles."

"Yours faithfully, P. H. COCKCROFT."

"You will be pleased to learn that in the recent End-to-end Competition I did not lose any marks, and have qualified for a gold medal. I was fortunate in not having a single puncture, and the two Shamrock Excelsior tyres stood up splendidly, and never were pumped up between Land's End and John-o'-Groat's. The Shamrock Gloria belts were also satisfactory.

"Yours faithfully, ARTHUR D. NICHOLSON."

"I have much pleasure in testifying to the good results gained by me in the End-to-end Reliability Trial by using one of your Shamrock Excelsior covers. I never had a single puncture all the way, the belt also answering satisfactorily. One of the successful competitors,

"ROBERT KING."

THE HANOVER RUBBER CO.,

29-31, Old Street, LONDON, E.C.

July 20th, 1908.

Messrs. The N.S.U. Motor Co.

Gentlemen,—In the recent A.C.U. Land's End to John-o'-Groat's Reliability Trials I gained Gold Medal with the loss of no marks on my $3\frac{3}{4}$ h.p. N.S.U. (two-speed gear). I had a splendid ride in spite of continual rain and bad and greasy roads, the machine giving me every satisfaction. The two-speed was a source of joy to me, as I was able to climb hills and face head winds, using it where machines of greater horse-power and less total weight miserably failed.

(Signed), S. W. CARTY.

Things you ought to have .
N.S.U. non-skid device 3/6.
N.S.U. sparking plug.
N.S.U. belt fasteners.
N.S.U. two-speed gear.

Have you read it?

We published Mr. Carty's letter last week—probably you saw it. We repeat it this week not only to call your attention to the splendid performance of the N.S.U. but to point out to you the importance of the last paragraph.

The two-speed gear referred to in the letter is the N.S.U. Now it is well known that a machine fitted with a two-speed gear will climb hills better than one that is not. If the machine is the N.S.U. fitted with the N.S.U. two-speed gear, you can say goodbye to all future hill-climbing difficulties.

MOTOSACOCHE

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

Adjustments to obtain Slow Running.

My twin-cylinder machine is a real flier, but unfortunately it will not run slowly, that is at six miles an hour, unless I continually lift the exhaust valves. I would sacrifice a little speed in order to run slower in traffic, and shall be glad of advice as to what to do to make the engine run slowly. I may mention it has magneto ignition, automatic inlet valves, and Longuemare carburetter.—MICK.

I could either time the magneto a little slower or fit inlet valve springs of slightly weaker tension than those in use on the machine. These alterations would enable you to run slower, and a still further improvement could be effected by careful adjustment of the carburetter and handle-bar control. Try one size smaller air adapter spray, and note the difference.

The Winding of Magneto Armatures.

I should be pleased if you could answer the following questions with regard to a Bosch magneto, which I wish to re-wind: (1.) What gauge of wire is used for the primary, and how many layers? Also the gauge of the secondary? (2.) Are the layers of the secondary insulated in the same way as the layers of a coil, viz., with waxed paper? (3.) What is the longest spark that I may expect if the winding is a success? I have wound several spark coils with good results, so do not think that a magneto armature should be any more difficult.—H.J.S., Liverpool.

It would be absolutely inadvisable for you to attempt to wind the armature of a magneto. There are only a few expert workmen who can accomplish this, and special machinery is required. (2.) The exact quality and quantity of the wire is only known to the makers. (3.) A properly wired magneto armature should give a $\frac{1}{2}$ in. spark easily.

Route from North to South.

I wish to go to Bexhill-on-Sea, *via* Nottingham, and to miss London and as many large towns as possible. I shall be greatly obliged if you can tell me which is the best route for me to take? (3½ h.p. Phelon and Moore, two speeds.) I should also like to have a good route from Bexhill to Yeovil, and thence up again to Darlington, omitting Wales. I do not wish to do too long a run daily, and have plenty of time to do it in, and you can suggest reasonable breaks under these conditions I shall be glad.—G.D.W., Darlington.

Your best route would be as follows: Darlington, Northallerton, Boroughgate, Wetherby, Aberford, Doncaster, Worksop, Mansfield, Nottingham, Leicester, Northampton, Newport Pagnell, Woburn, Hockliffe, Dunstable, High Wycombe, Chesham, Slough, Windsor, Egham, Cobham, Leatherhead, Dorking, Horsham, Cowfold, Hurstpierpoint, Lewes, Polegate, and Bexhill. From Bexhill to Yeovil will be as follows: Bexhill, Pevensey, Lewes, Sturminster Newton, Partridge Green,

Billingshurst, Petworth, Midhurst, Petersfield, Winchester, Stockbridge, Salisbury, Shaftesbury, Sherborne, and Yeovil. From Yeovil to Darlington proceed as follows: Yeovil, Sparkford, Bruton, Frome, Bradford, Chippenham, Malmesbury, Cirencester, Burford, Chipping Norton, Banbury, Daventry, Kilsby, Catthorpe, Market Harborough, Corby, Weldon, Stamford, and then up the Great North Road to Darlington. You can easily arrange the breaks yourself. About 150 miles per day would be a suitable distance to cover.

R. Moore (3½ h.p. two-speed P. & M.), winner of a gold medal in the End-to-end Run. In four consecutive A.C.U. six days' trials, this rider has performed successfully.

How to Drive and Causes of Knocking.

(1.) Please say which of the following mixtures will heat my 3½ h.p. motor cycle engine the least. Smallest portion possible of gas, which will not allow any extra air, or a medium allowance of gas which will take half extra air. Will you please also enlighten me on the following: (2.) I take it knocking in an engine occurs when spark is advanced too far consistent with speed. Why should it occur when spark is quite retarded? I should also be glad to know the actual cause of the sound, and its probable effect on the engine if allowed to continue? (3.) What size jet and choke tube would you advise for summer riding? I am a nine stone rider, 3½ h.p. engine.—H.C.

(1.) The most economical way of running would be to drive on as little gas as possible, and use extra air if the engine will take it. (2.) Knocking may also be caused by too high compression and wear of the engine bearings. The higher the compression the more easily the charge is exploded, and if the cylinder is very hot the charge is often exploded independently of the spark. The cause of the sound of knocking is due to the explosion taking place before the piston has reached the top of the compression stroke. The ultimate result is excessive wear of the engine and connecting rod bearings. (3.) The correct size jet and choke tube can only be arrived at by experiment.

READERS' REPLIES.**Route to Scarborough.**

The answer you give to an enquirer for the best route from London to Scarborough is not the best in my opinion. There is a small ferry across the river to Howden, and the approaches on both sides are bad; the road across the Yorkshire Wolds from Driffield is also very hilly. He should not go to Doncaster, but turn off the North Road at Bawtry, then by Thorne, Snaith, Selby, York, and Malton. I have ridden these routes on a push bicycle, so speak from experience.—YORKSHIRE TIE.

The G. and A. Carburetter.

I have one of these on a 4½ h.p. twin Minerva, and I climbed Pebble Hill, gear about 4 to 1, weight of rider twelve stones, and rubber belt. My machine is a Chater-Lea No. 6 frame with 4½ h.p. engine. As for consumption of petrol, I have not really tested it, but with forecar attached I went to Brighton and back—about 115 miles—on two gallons. It is rather difficult to adjust, but when adjusted is O.K. By taking out two or three balls in hot weather one can cut down petrol consumption. For climbing hills I am certain an extra air slot on inlet pipe would be an advantage, for as the machine slows up there is not enough suction to lift the balls, and you are taking in nearly pure petrol, but for touring they are really good, especially in traffic, when after slowing down you have not got to grab at extra air lever to start again without misfiring. Can thoroughly recommend one. If "R.G.P." gets one I shall be pleased to give him a tip for adjusting same.—A. H. DOHERTY.

Difficulty in Starting.

In reply to "B.B." N.B., who complains of hard starting and inability to throttle down with a Longuemare carburetter on Phoenix Trimco. If this machine is fitted with a throttle of the butterfly or disc pattern, he will most probably find that the spindle of this has worn and got considerable play, and thus allows a large leakage of air into the inlet pipe. In your reply you advise fitting a smaller choke tube, and this would certainly facilitate starting and slow running, but I should advise him to see if the above defect exists first, and if so to remedy it, when I think his trouble will vanish. The query of "H.H." Chiswick, also reads as if his machine suffered from the same defect. I have been troubled in the same way myself with a twin Rex, and have seen the same fault on various machines, one only recently. The owner complained of hard starting, difficulty in slow running, and high consumption, and I am sure there are scores of machines with this form of throttle. They may be remedied either by truing the hole and fitting a new spindle, or a good makeshift is to get a stout piece of leather and bind round the pipe with wire and fit the old spindle through the leather. This will last even longer than metal, but is rather unsightly. A new throttle disc will also probably be required, as the old one will be worn inside the pipe.—H.K.

HINTS AND TIPS FOR MOTOR CYCLISTS. By Road Rider

(Continued from page 602.)

MISFIRES (CONTINUED).**2. MISFIRES AT SPEED.**

All the previously mentioned troubles will be noticed most at speed.

Mixture can now be tested by altering air lever.

Trembler needs firmer adjustment—most probable solution.

Valve sticking.

Wiper of contact maker jumping its segment.

Spark plug sooty, or too wide a gap at points.

Carburettor drained dry of petrol.

3. OCCASIONAL MISFIRES.

Pre-ignition through hot particle in cylinder.

Moving some part of machine, such as timing lever, sets up a short circuit in a particular position.

Small particle of dirt in carburettor.

Fragment of carbon on plug points.

Exhaust or inlet valve momentarily sticking up.

Loose dirt or dirty oil in contact breaker.

Swinging wire, or loose packing of coil and batteries.

4. MISFIRES SOON AFTER STARTING.

Plug developing fault when warmed.

Batteries running down.

Valve distorted with heat, or too tight a fit in guide, and so sticking.

Note.—With a high tension magneto, always suspect the sparking plug as the most likely culprit for misfires; with a trembler coil, suspect the coil trembler first; with a plain coil, suspect the make and break contacts.

METALLIC NOISES.

247. An unaccustomed metallic noise in the engine should fetch the rider to a standstill faster than the raised hand of a policeman, and under no circumstances should he proceed till the cause of the noise is found and removed. It is almost certain to be due to under-lubrication, and if oil is injected and worked into the parts by revolving the engine by hand or foot, the noise will probably cease.

OVERHEATING.

248. A motor cyclist is prone to accuse his engine of overheating whenever it misbehaves and simultaneously runs rather warm. Real overheating is the rarest thing in the world, but some of the following are frequently mistaken for it:

1. A choked exhaust, due to weak exhaust valve spring, dirty silencer, narrow or much-bended exhaust pipe, wear on valve cam, camshaft, valve tappet, wrong timing of exhaust valve, and movement of adjustable tappet.

2. Failure of lubrication through pump going amiss, through too much web on top of crankcase, choking of an oilway, stoppage of pipe, use of unsuitable or counterfeited oil, loss of drain tap, over driving the engine without extra lubricating, and forgetfulness to oil up.

3. Collection of carbon on piston head and cylinder, which raises compression.

4. Too high a gear (very common when overheating is supposed to occur only on hills).

5. Too rich a mixture, causing engine to get too hot, and so preventing lubrication.

6. Pre-ignition through a particle of metal, porcelain, carbon, or rough edge on casting getting incandescent, and causing engine to fire early or to continue firing when switch is off. Sparking plug insulation may fail altogether.

7. Ignition too far retarded for speed of engine and work it has to do.

8. Failure of water system by pump stoppage, choked tubes, dirty radiators; inefficient cooling by air flanges owing to encrusted mud and oil.

9. Very tight piston rings, or connecting rod or crankshaft bearings; valve expanding and sticking in guide; valve expanding and fouling tappet when tappet is down.

10. Overdriving the engine for long periods on a very low gear.

C. G. Hogan (twin Vindee) first on handicap and fastest time, in the first motor cycle hill-climb held in South Tasmania on May 30th.

REMOVING TIMING GEAR.

249. When compelled to dismount the timing gear of the valves or ignition, the trouble of re-timing in the event of the pinions being unmarked is easily avoided by gently prising the cover away from its joint, and then holding wheels in mesh with a wire or spoke before cover is lifted off. If the wheels are not stamped for re-engagement, they may now be stamped with punch or marked with a file before they are disturbed.

RUSTY RIMS.

250. Rust between the beads of the rim is a deadly foe to the tyres. Once or twice in a season the rims should be bared and sandpapered clean. A coat of enamel may then be given.

SHORT CIRCUITS.

251. "Shorts" may be due to grease, metallic contact, or broken wires. The commonest forms are due to a wire chafing through where it runs close to the tank or frame. The apertures in accumulator box should always

be large, and the wire should have double protection where it issues from them. Until expert enough to trace shorts by the eye, always carry a length of bell wire, and if no spark is found at the contact breaker or the sparking plug, detach each piece of wire in turn and replace by the length of bell wire temporarily; then see if the errand spark has returned. This is the sure and shortest method for novices, but machine be at all new it is fair certain to arise from a loose wire terminal.

Avoid frayed strands of wire at connections, which may touch other terminals.

Avoid small and flimsy switches, which shorts are very common.

A blow on cover of contact breaker will often cause a short; notice if cover be dented.

Keep wire as short as possible, and if possible run all wires inside rubber tubes slipped over them.

Water on switch, contact breaker, exterior of magneto is a sure conveyor of shorts if on the right place.

Cheap low tension wire often snags under its insulation, and should be avoided.

If a very tricky spasmodic short occurs, a sure test is to watch for it with machine running on stand in darkness. It is likely to be inside the coil box. High tension wiring becomes porous in time, and the current will leap through it to any adjacent metal.

SOLDERING.

252. Every motor cyclist who does not know how to solder should teach himself. Neat pocket cases may be had for a couple of shillings containing spirit, solder, iron, and an automatic blow lamp.

SPRINGS FOR AUTOMATIC INLET VALVES.

253. The opening of an automatic inlet valve has a greater bearing on the running of the engine than the spring, and is usually set to open too far. 3-32in. or even 1-16in. is usually right. The spring may for speed events be as strong as the engine will start on, i.e. if the spring be so strong that the engine cannot suck it open when the machine is pushed to start it, a slightly weaker spring must be fitted. With twin-cylinder engines press the stems of the two valves together, and adjust springs so that both valves open simultaneously.

TESTING SPARKING PLUGS.

254. No sight is commoner than that of an irate motor cyclist testing his exposed sparking plugs for spark. He puts them on the cylinder head while he breaks or makes contact, and they roll off; he holds the wire with one hand, and takes a healthy shock. It is the simplest thing in the world to bolt a light iron bracket to the engine with a drop hole to catch plug body in such a position that the plug is comfortably supported with its head to frame contact.

(To be continued.)

A.C.U. TWENTY-FOUR HOURS RIDE.

THE annual twenty-four hours run from London to Plymouth and back—a distance of about 420 miles—will start from the Angel Hotel, Thames Ditton, on Friday, August 7th, at 9 p.m., and the route followed will be *via* Guildford, Salisbury,

the time allowed being 1h. 32m. each way, and competitors who arrive within three minutes either in advance of or behind this time will qualify for a gold medal, provided the performance on the other part of the journey merits it. Those competitors who com-

Reproduced from the Contour Road Book of England by permission of Messrs. Gall and Inglis.

Yeovil, Honiton, Crewkerne, Exeter, Ivybridge, Plymouth, and the reverse for the return journey. Between Yeovil and Honiton (see contour section reproduced) there will be a timed test, outwards and homewards,

complete the journey but fail to ride the timed section within the limits allowed will qualify for a silver medal.

Mr. G. H. Levick has kindly offered to present three silver cups in connection with this run.

End-to-end Trials. Some idea of the severity of Berriedale Hill can be gained from this illustration showing Miss Hind negotiating the last bend of the hill on her twin Rex.

Will readers kindly note that the telegraphic address of the Dunlop Tyre Co. is not "Pneumatic," Birmingham, but "Covers," Birmingham?

The Moto-Rêve Company write: "With reference to the table of results (pages 600-602) given in last week's issue of *The Motor Cycle*, we would like to bring to your notice the fact that the Moto-Rêve which was ridden by W. Smith did not retire on account of broken works, as reported. He had no trouble whatsoever with these or with any other portion of his machine until about eighteen miles from Inverness. Up to this point we are given to understand that he had not lost a single mark. A portion of a sparking plug then broke (the star portion), and, falling into the cylinder, caused breakage of the latter and his consequent retirement."

Brown Bros., Ltd., Great Eastern Street, E.C., inform us that they have in stock a few shop-soiled, but otherwise perfectly new, Brown motor bicycles with coil and accumulator ignition, which are being offered at exceptionally low prices.

Mr. J. N. Taylor, of Adelaide, has just been presented by the Automobile Club of South Australia with a certificate for a fifty-two miles reliability and speed-judging competition. The contest was over all classes of road, up and down hill, the competitors having to ride throughout at a pace of eighteen miles per hour. This was a very difficult matter, there being no mileposts, no watches being allowed, and the competitors, who did not know the time when they started, were forbidden to enquire *en route*. Mr. Taylor's performance was achieved on a $2\frac{3}{4}$ h.p. Minerva motor cycle.

CURRENT CHAT

Sydney
R. Jones 408

Open Hill-climb at Newnham.

Entries for the Coventry M.C. open hill-climb at Newnham, Daventry, on August 15th, close on Saturday next, the 8th inst. Already a good number has been received.

Germany's Trade in Motor Cycles.

During the first five months of 1908 Germany exported motor cycles weighing 67,600 kilos., as against 92,500 kilos. during a like period in 1907. Exports to Holland and Denmark dropped, while Great Britain took 22,400 kilos. in lieu of 18,500 kilos. Germany imported 12,100 kilos., the bulk coming from Belgium. Austria-Hungary sending across 1,900 kilos.

Great Orme's Head Climbed.

Great Orme's Head, Llandudno, was climbed on Monday of last week by Councillor W. D. Coddington, of Southport, driving a 60 h.p. car. We understand Mr. R. C. Griesbach, a motor cyclist who was staying at Llandudno, afterwards had a try on his 3½ h.p. 1908 Triumph, and made two ascents without a stop, this with a gear of 5½ to 1. This is not the first occasion on which the Orme has been scaled on a motor cycle, as Mr. J. Edge, of Liverpool, two or three years ago accomplished a similar feat. Great Orme rises 700 feet above the sea level, the average gradient for half a mile is 1 in 5, and then after a sharp turn the gradient for eighty yards is said to be 1 in 3½. The last 200 yards is trackless, lumpy turf, and strewn with large stones. Quite a number of visitors witnessed the ascents.

Racy-looking Motor Cycles.

A reader tells us that it is not always advisable to make a machine look racy in appearance. The police in his district are keeping a most vigilant eye upon him, merely because he has had one or two alterations made to his machine which have made it look somewhat racy, whereas it is not so by any means.

The Late Mr. Cecil Edge.

We regret to have to record the death of Mr. Cecil Edge, cousin of Mr. S. F. Edge. Mr. Cecil Edge had been ailing for some considerable time with a serious chest complaint, and he passed away on Monday evening of last week. He was at one time a very successful motor cyclist, and won many events on single track machines. In the first 1,000 miles trials he occupied the front seat of an Ariel quadricycle driven by Mr. J. W. Stocks. Latterly, he has been closely connected with the business of the Napier Co.

Motor Union Provincial Dinner.

The Motor Union eleventh provincial dinner was held at the Hotel Majestic, Harrogate, on the 25th ult., the chair being taken by Mr. E. H. Heppie, chairman of the Yorkshire A.C., supported by the Mayor of Harrogate and several other influential Northern motorists. The chairman of the Motor Union, Mr. Joynson-Hicks, M.P., was prevented from attending owing to the late sitting of the House.

FUTURE EVENTS.

- Aug. 7—A.C.U. 24 Hours' Ride London to Plymouth and back.
- " 8—Essex M.C. Open Race Meeting for Motor Cycles at the Stadium.
- " 15—Coventry M.C. Open Hill Climb for Motor Bicycles and Passenger Motor Cycles at Newnham Hill, Daventry.
- " 21-22—Motor Cycle Union of Ireland Open 400 Miles Reliability Trials for the Muratti Trophy.
- " 22—A.C.U. Annual Race Meeting at the new Stadium, Shepherd's Bush.
- " 22—General Inter-club Meet of Motor Cyclists at Stratford-on-Avon, organised by the Birmingham M.C.C.
- " 29—Essex M.C. Open 200 Miles Non-stop Run for Motor Cycles.
- Sep. 12—Motor Cycling Club Petrol Consumption Tests.
- " 23—The International Auto Cycle Tourist Trophy Race in the Isle of Man.
- " —Penalty Run for Members of the A.C.U. and Clubs in the South of England Districts affiliated to it.
- Oct. 3—A.C.U. Council Meeting at Warwick.
- Nov. 20-28—Thirty-second Annual Stanley Show.

Essex M.C. Race Meeting at the Stadium.

On Saturday next, at the Stadium, the first purely motor cycle meeting will be held at this up-to-date track. This is the third annual meeting of the Essex M.C., and nearly all the cracks in the motor cycle world will compete. In addition to the events already mentioned, attempts will be made on the mile and ten miles records.

Another Case of Injustice.

The Northern Police Court (Dublin) about six weeks ago fined a motor cyclist £10 for exceeding the speed limit in the Phoenix Park, and £2 10s. on each of two other counts. Last week, for the same offence, a car driver, having the luck to appear before a different judge, was fined 1s. and 3s. 5d.

Special Features

SOME EXPERIMENTS WITH CRANK-CASE COMPRESSION.

HOLIDAY EVENTS (ILLUSTRATED).

costs, his speed being 24½ miles per hour. Is there any justice in these two decisions? What excuse the judges can have for inflicting such unproportionate fines it is difficult to say. If they have been reversed probably there would have been less surprise on either side. What a pity these cases do not receive more intelligent consideration.

Motor Cycling A.A. Scouts.

In *The Motor Cycle* of the 22nd ult. we remarked upon the inefficient scouting on the Maidstone and Sevenoaks Roads where the police are active. In the *Daily Telegraph* of the following Saturday the following advertisement appeared: "Motor cyclists.—The Automobile Association has a few vacancies for smart, intelligent men, of good class, riding their own machines.—Apply with full particulars, make, h.p., experience, etc., letters only, A.A., Prince's Buildings, Coventry Street, W." Undoubtedly the motor cycle mounted scout and inspector will be at a big advantage. We are confident that the Kent authorities will give the scouts their assistance, if not leave the control of motor traffic entirely in their hands. A motor cyclist of experience, thoroughly acquainted with Kent roads, has offered his services. The new move of the A.A. should effectually check excessive speeding, as road hogs will not be able to escape the scout mounted on a good motor bicycle. As most of our readers know, American police very extensively

for the suppression of furious driving.

Road Race in France.

The Motor Cycle Club of Lyons held a road race on the 26th ult. over a distance of 192 kilometres. The course was forty-eight kilometres in length, and had to be covered four times. The winner rode a Magnat-Debon 2¾ h.p. motor bicycle, and completed the course in 4h. 24m., the second and third successful competitors rode similar machines. To show the difference between reliability and pure speed Dravoub, on a Peugeot motor bicycle, covered one lap of the course in 55m., but was only placed fourth in the actual contest. Dravoub's speed is equal to 32¾ miles per hour. The winner's time is equal to an average of 27¼ miles per hour over the whole distance.

Police Traps.

Fines amounting to £51 12s. 8d. were imposed in one day by the Dorking Bench on motorists and motor cyclists for exceeding the speed limit at Mickleham.

There is a measured mile near Swansea, on Fairwood Common (the Port Eynon Road), Gower, Glamorganshire, and a four miles trap on the Pontardulais Road, worked from the Pentleagaer Police Station to the Pontardulais Police Station.

Crystal Palace Race Meeting.

On Bank Holiday Monday, the Anerley B.C. included four events for motor cycles at its race meeting at the Crystal Palace. The results were: Five miles handicap—1, H. A. Collier ($3\frac{1}{2}$ h.p. Matchless), scratch; 2, J. E. Bailey ($2\frac{3}{4}$ h.p. Eland), 20s. start; 3, R. G. Dendy ($3\frac{1}{2}$ h.p. Brown), 15s. Winner's time, 7m. 11 $\frac{1}{2}$ s. A mile match between R. G. Dendy (5s. start) and H. A. Collier was won by the latter in 1m. 39 $\frac{1}{2}$ s. Three miles match—1, R. G. Dendy (15s. start); 2, H. A. Collier (scratch). Won by four lengths. Time, 5m. 26s. Five miles match—1, H. A. Collier (scratch); 2, R. G. Dendy (25s. start). Time, 7m. 9 $\frac{1}{2}$ s.

M.C.U.I. (Dublin Centre).

On Saturday afternoon last the members of the Dublin Centre of the Motor Cycle Union of Ireland held a hill-climbing competition on the hill leading from Kilmacanogue, Co. Wicklow, over the shoulder of the Great Sugarloaf, to the top of Calary bog. The weather was fine, and there was a large gathering of motor cyclists to witness the competition. As usual, there were two classes; in the first pedalling was allowed, while in the second it was barred except for the first 100 yards. The results were determined on a formula in which the weight of the machine and driver, the horse-power, and the time taken were the factors. Both classes were won by R. Walshe, and as the appended details will show, the placings in each class

were the same. Pedalling class.—R. Walshe (80 by 60 J.A.P.), 245 points, 1; D. Gill (85 by 76 J.A.P.), 247, 2; R. Dunphy (85 by 76 J.A.P.), 252, 3; H. Quinn (75 by 80 Triumph), 289, 4; P. Hurse (75 by 75 Peugeot), 337, 5; C. B. Franklin (82 by 85 twin Minerva), 350, 6. Non-pedalling class.—R. Walshe (85 by 60 J.A.P.), 231, 1; D. Gill (85 by 76 J.A.P.), 236, 2; R. Dunphy (85 by 76 J.A.P.), 241, 3; P. Hurse (75 by 75 Peugeot), 40, 4; C. B. Franklin (82 by 85 twin Minerva), 340, 5. Mr. J. A. Armstrong, the hon. sec., timed at the foot of the hill, and Mr. N. E. Drury, the assistant hon. sec., acted at the top.

The A.C.U. Defends a Motor Cyclist.

On behalf of the Motor Union, Mr. Maddocks, solicitor, Coventry, attended the hearing of a summons at Southam (Warwickshire) against Mr. W. G. McMinnies for exceeding the speed limit. This was a case where two

riders entered a measured distance with about ten or twelve yards between them, and came out of it in the same position. The first two constables in cross-examination admitted that neither of them had actually timed the defendant, who was behind, and only gave evidence as to speed, one of them stating that Mr. McMinnies was travelling very fast. The third constable only gave evidence as to signalling when Mr. Molyneux (the first rider) came past him, and admitted that he gave no signal respecting the defendant. It was contended that there was no evidence whatever of timing, and that the only ground upon which the magistrates could convict was that of the witnesses as to speed. As only one constable had spoken as to speed, the provision made by Section 9 applied, namely, that no person can be convicted on the evidence of one witness alone. After some deliberation the justices dismissed the case.

Anerley B.C. Race Meeting at the Crystal Palace. Ready for the Five Miles Open Handicap, won by H. A. Collier ($3\frac{1}{2}$ h.p. Matchless), in 7min. 11 $\frac{1}{2}$ secs.

M.U. MOTOR CYCLE NOTES.

The secretary informs us that judged by the number of applications received by the Motor Union the new scheme of membership for motor cyclists "fills the bill." The insurance arrangements appear to be particularly appreciated.

The M.U. has sent the following letter to a number of motor cycle clubs: "As you will be aware, the agreement that has been entered into by the Motor Union with the A.C.U. terminates the arrangements under which members of clubs affiliated to the A.C.U. were also members of the Motor Union. The connection which previously existed between your club and the Motor Union has, therefore, ceased. It is very possible, however, that there are many individual members of your club who wish to continue their connection with the Motor Union by joining it in an individual capacity. I enclose you herewith a new prospectus which the Motor Union has prepared for individual motor cyclists, and ask the assistance of yourself and your committee in bringing it to the attention of your members. Although official relations have been terminated the Motor Union at any time will be very glad to render your club any assistance in its power, and to do what it can to further the motor cycle movement in your district. This co-operation will be rendered more complete if there is a considerable number of motor cyclists who are members both of your club and the Motor Union."

The address of the secretary is 1, Albermarle Street, W.

A.C.U. TWENTY-FOUR HOURS' RIDE.

The following entries have been received for this event, which starts on Friday next, August 7th, at 9 p.m., from Thames Ditton.

H. G. Cove ($3\frac{1}{2}$ h.p. H.G.C.), H. M. Bentley ($3\frac{1}{2}$ h.p. Triumph), A. W. Bentley ($3\frac{1}{2}$ h.p. Triumph), W. O. Bentley (5 h.p. Rex), H. V. Davidson, jun. ($3\frac{1}{2}$ h.p. Zenette), F. C. Wood (6 h.p. N.S.U. with sidecar), C. H. Barfield ($3\frac{1}{2}$ h.p. Triumph), W. H. Bashall ($3\frac{1}{2}$ h.p. Triumph), W. Pratt ($3\frac{1}{2}$ h.p. L.M.C.), E. W. Ashworth (7 h.p. Minerva), E. Nelson (5 h.p. Rex), M. Geiger (6 h.p. N.S.U. with sidecar), G. E. Purchase ($3\frac{1}{2}$ h.p. Triumph), A. Stanley Phillips (5 h.p. Vindec Special), Eli Clark ($2\frac{3}{4}$ h.p. Douglas), W. W. Douglas ($2\frac{3}{4}$ h.p. Douglas), W. Smith (2 h.p. Moto-Rève), Gordon Fletcher (2 h.p. Moto-Rève), F. Toman (5 h.p. Laurin and Klement), W. E. Burkin ($2\frac{3}{4}$ h.p. Laurin and Klement), H. A. Cooper (3 h.p. Triumph), F. Hansford (5 h.p. Vindec Special), F. Cozens (10 h.p. Lagonda Tricar), F. W. Applebee (5 h.p. Rex), F. Applebee, jun. ($3\frac{1}{2}$ h.p. Rex), O. C. Godfrey ($3\frac{1}{2}$ h.p. Rex), O. Von Saal (5 $\frac{1}{2}$ h.p. Phänomen and sidecar), F. W. Barnes ($3\frac{1}{2}$ h.p. Zenette), and W. J. Newman (4 h.p. Roc).

Our Advertisement Department desires us to notify advertisers in the "Miscellaneous Advertisement" columns that, owing to the August Bank Holidays, all advertisements received after Thursday last have been unavoidably held over until the next issue.

M.C.C. London to Land's End and Back Run.

GLORIOUS weather favoured the start of the Motor Cycling Club's run from the Berkeley Arms Hotel, Cranford Bridge, near Hounslow, at 4 a.m., on Monday last, when the first of twenty-one riders was dispatched on the journey to Land's End and back, in competition for the Jarrott Cup. The other twenty competitors were started at intervals of two minutes. Mr. Charles Jarrott, the donor of the cup, and an erstwhile enthusiastic motor cyclist, was unable to be present, but sent a large car to carry the observers over the route. The officials on the programme were: Starter, W. H. Wells; timekeeper, F. T. Bidlake; sealer, Dr. Gibbons; travelling marshals, E. B. Dickson, F. J. Jenkins, R. H. Head, W. H. Wells, and Dr. Gibbons.

The starters were as follows: E. Gwynne (5 h.p. Vindec), G. Rowden (4 h.p. Jap), H. Myer (3½ h.p. Rex), C. C. Cooke (3½ h.p. Triumph), O. Summers (5 h.p. Vindec), Walter W. Adam (3½ h.p. Triumph), H. G. Bell (3½ h.p. Triumph), A. Sproston (5 h.p. Rex), D. S. Baddeley (5 h.p. Baddeley), C. Lacey (3½ h.p. F.N.), R. Clark (5 h.p. Fafnir), S. G. Frost (4½ h.p. Minerva), G. Fletcher (2 h.p. Moto-Rêve), W. Smith (2 h.p. Moto-Rêve), A. Bentley (3½ h.p. Triumph), W. Bentley (5 h.p. Rex), J. O. Dixon (5 h.p. Vindec), J. Winslow (5 h.p. Rex), V. Olsson (5 h.p. Vindec), H. Dougal (5 h.p. Vindec), and F. G. Smith (3½ h.p. Triumph).

The only non-starters were: H. Beasley (5 h.p. Rex), C. Seed (5 h.p. Vindec), L. A. Baddeley (3 h.p. Baddeley), W. H. Wells (5 h.p. Vindec), and A. S. Phillips (5 h.p. Vindec).

The route was by way of Staines, Bagshot, Basingstoke, Andover, Salisbury, Yeovil, Honiton, Exeter, Okehampton, Launceston, Bodmin, Redruth, and Pen-

Mist was encountered at Camborne (254½ miles); otherwise the weather was fine. The roads in many places were suffering from drought, and were consequently loose and stony, and many punctures were

Competitors in the M.C.C. Run en route for Land's End passing through Basingstoke at 5.30 a.m. on Monday last. The rider in the foreground is Arthur W. Bentley, the End-to-end record holder, who is contemplating further doughty deeds on his Triumph.

experienced. The order of arrival at Penzance on the return from Land's End was as follows: Gwynne, Summers, Bell, Adams, Frost, Baddeley, Lacey, Cooke, Dixon, Dougal, Smith, Sproston, Olsson, Fletcher, W. Bentley, A. Bentley, and W. Smith. The first competitor arrived at 7.42 p.m., the second at 7.46 p.m., the third and fourth together at 7.50 p.m., and the last at 8.53 p.m.

The return journey was made on Tuesday.

Position of the Magneto.

The frightful roads and weather encountered by the End-to-end riders in the later stages of their very trying run had a natural result. More than half of the riders were hung up more or less often with magneto troubles. Ninety per cent. of present-day machines carry the magneto low down on a tiny platform forward of the crank case. If the front mudguard has a big flap, it is quite inadequate to protect the magneto from the swish of water when the machine drops into a flooded pothole or rips through a pool. If covers are used, they are by no means impervious to water from above or beneath, and they are awkward to detach when the contact breaker needs a wipe over or a high-tension lead springs off its terminal. On the other hand, I have quite as strong a dislike to carrying the magneto in the tank. It spells unnecessary weight and an undesirable reduction of tank capacity. I don't think there is the least doubt that the Roc and Quadrant people are on the right track when they set their magnetos on a platform abaft the engine, high enough up to dodge the splashes, and sufficiently far away from the cylinder to be safe from heat. At any rate, I know a number of motor cyclists who would have given all they were worth in Scotland to have had magnetos so situated on their machines, and to this many a Colonial rider will ejaculate a stentorian "Hear, hear!"

IXION.

The M.C.C. London to Land's End and Back Run for the Jarrott Cup. Starting competitors from the Berkeley Arms, Cranford Bridge, at 4 a.m., August 3rd. F. T. Bidlake, official timekeeper, despatching O. Summers (5 h.p. Vindec) and W. W. Adams (3½ h.p. Triumph).

zance. a distance of 267¾ miles. Another ten miles took the riders to Land's End, where the first competitor was scheduled to arrive at 7.7 p.m., and the return to Penzance was immediately made, a stop of about eight and a half hours being allowed at the latter place.

CLUB NEWS.

Richmond and District M.C.C.

The picnic at Newlands Corner was thoroughly enjoyed by all present. A hill-climb on the same day was won by E. P. Hois (5 h.p. Rex); 2, F. C. Wood (5 h.p. N.S.U. fitted with decar); 3, K. Lankester (9 h.p. Riley tricar). The president, the Marquis de Mouzilly St. Mars, has offered a challenge trophy for competition among members, and it has been decided to hold a reliability trial on August 5th and 16th, of about 150 to 200 miles, and that, in addition, medals shall be given to the winners. Entry forms can be obtained from Mr. H. C. King, hon. sec., Walton House, Surbiton Road, Kingston-on-Thames.

S.E. Auto Cycle Association.

The penalty run last Saturday was a great success, the following gaining full marks, having no mechanical trouble at all: H. A. Cooper, C. W. Evans, W. B. Whitaker, H. Gault, R. Boxer, and F. Munzing. Passenger class—W. Imms and the hon. sec. (H. B. Renner), who drove his h.p. tricar. Mr. Julian Orde, of the R.A.C., has accepted the office of president of the Association, and Mr. S. F. Edge vice-president. Full particulars of open hill-climb and light car trial can be had on application to the Hon. Sec., 31, Kidbrook Park Road, Blackheath, S.E.

Coventry M.C.

Entries for the open hill-climb at Newnham, near Daventry, will be accepted up to the first post on Monday, the 10th inst. It is likely that the complete list will be larger than in the case of the hill-climbing events held in 1906 and 1907. This year six classes have been included, embodying all types of motor bicycles and passenger machines at present in use. Further particulars and entry forms can be obtained from the trials hon. sec., Mr. W. F. Grew, 19, Hertford Street, Coventry. Messrs. W. H. Bashall (6 h.p. twin Jap), Guy Lee-Evans (5 h.p. Rex), Gordon Gibson (3½ h.p. Triumph), C. S. Burney (5 h.p. De Havilland), Geoffrey Smith (3½ h.p. Triumph), H. Tessier (6 h.p. Bat-Jap), C. A. Palmer (5 h.p. two-speed Roc), W. Newman (3½ h.p. two-speed Roc), J. Marshall (5 h.p. Triumph), and several others have already entered.

Barnoldswick M.C.

A successful hill-climbing competition was held at Salterforth Lane—a hill about half a mile in length, the steepest gradient of which is 1 in 9. Two thousand persons witnessed the competition. The results were worked out on the A.C.U. formula, and are as follows:

Rider and machine.	Time.
J. Windle (local make engine)	1m. 22½s.
F. Perry (2½ h.p. F.N.)	1m. 15½s.
W. Holden (2½ h.p. F.N.)	1m. 15½s.
H. Nutter (3½ h.p. Triumph)	56½s.
R. Nutter (3½ h.p. Triumph)	58½s.
P. Brown (2½ h.p. Bradbury)	1m. 21½s.
S. Wormwell (5 h.p. Vindec)	58½s.
J. Lomax (3½ h.p. N.S.U.)	1m. 15½s.
A. T. Elmer (8 h.p. Rexette)	2m. 22s.

The starter was J. T. Butterworth; timekeeper, F. Baldwin, with the assistance of H. Strickland.

Bolton and District M.C.C.

The above club held a speed-judgment contest on July 5th, the distance being two miles at a speed of eighteen miles an hour. The result was:

1. P. Yates (2½ h.p. F.N.)	6s. fast
2. A. Richards (2½ h.p. Minerva)	22s. "
3. J. Green (4½ h.p. Minerva)	36s. "
4. H. Holt (4 h.p. Roc)	1m. 13s. slow
5. J. Foster (3½ h.p. Triumph)	1m. 15s. "
6. J. Fishwick (6 h.p. N.S.U.)	1m. 48s. "
7. A. J. Moorhouse (5 h.p. Rex)	1m. 53s. "

A hill-climbing competition has been arranged for August 5th, divided into two classes, for single-cylinder and twin cylinder machines. No practising will be allowed on the hill. A gold medal will be presented for best placing on formula in each class, a bronze medal for second in each class, and a medal for fastest time in each class. Entrance fee, 6d. Entry forms can be obtained from the hon. sec., A. Richards, Sunny View, High Street, Bolton.

Bradford M.C.C.

On Saturday, July 25th, the annual hill-climbing competition for the Dyson Challenge Shield, so generously presented by Messrs. Dyson, Ltd., was held. The holder was E. S. Myers, but the trophy has now changed hands, and it will be in the keeping for the next twelve months of Mr. A. A. Scott, who rode a two-stroke 3 h.p. Scott of his own design. The results on formula and time are given below:

Rider and machine.	Fig. of merit.	Actual time.
1. A. Scott (3 h.p. twin-cylinder Scott)...	594	2m. 8½s.
2. W. Jowett (3 h.p. twin-cylinder Scott)	681	2m. 5½s.
* P. Dyett (3½ h.p. T.T. Triumph) ...	703	1m. 50½s.
* E. Myers (3½ h.p. T.T. Triumph) ...	703	1m. 30½s.
4. P. Cockcroft (3½ h.p. T.T. Triumph) ...	738	1m. 37½s.
5. H. Shaw (3½ h.p. Triumph) ...	823	1m. 56½s.
6. H. Gerhartz (5 h.p. Vindec) ...	869	1m. 34½s.

* Tied for third place.

J. Scriven (5 h.p. Rex), who at his first attempt on the hill came to a standstill owing to the failure of the petrol supply, was officially timed to make the ascent in 1m. 30½s.,

Essex Beagles A. and C.C. Open Motor, Athletic and Cycling Meeting at Canning Town Track on Monday last. The only motor cycle event was a ten miles handicap for machines with engines not exceeding 76x76 mm., or the equivalent volume swept out. The winner was H. V. Colver (2½ h.p. Matchless-Jap), who in our picture is lying second. He completed the distance in 12 min. 30 sec., followed home by G. H. Gerhard (2½ h.p. Brooklands), who is last in the picture. Third place was occupied by T. A. Carter (2½ h.p. Matchless), who is depicted above cutting out the pace for Colver.

but was ruled ineligible for the trophy. The hill was nearly a mile in length, and the Chief of Police had very kindly sent constables to marshal the course. The trial was arranged by Mr. F. Scriven (trials hon. sec.), and Messrs. Forbes and Johnson acted as timekeepers and superintended the weighing in of competitors and their machines.

Manchester M.C.

The results of the motor cycle reliability trials held by the above club on the 2nd and 3rd inst. are as follows: Outward journey Manchester to Cheltenham 177 miles. Twenty-two entries were received, and the following made non-stop runs: J. Tytler (3½ h.p. Triumph), H. Reed (4 h.p. Dot), C. E. Kettle (3½ h.p. Triumph), W. H. Heaton (5 h.p. Rex), Otto Gross (4½ h.p. Eagle Runabout), and T. E. Leigh (3½ h.p. Triumph). The trial was a very severe one over hilly roads, and some of the competitors did not succeed in climbing Rock and New Invention Hill. A. Moorhouse, on a 5 h.p. Rex, did the fastest time in the timed hill-climb, but unfortunately thirty miles from home his tyre punctured badly, so spoiling his chance of winning the cup, as he failed to arrive at the control within schedule time. The return run was commenced on the 3rd at 8 a.m., the competitors travelling *via* Daventry, Lichfield, Stone, Nantwich, Knutsford, and Altrincham to Manchester.

Club News.—

Cambridgeshire M.C.C.

The tie between Messrs. W. King, C. W. Wilson, and P. V. Wallis for the reliability trial of the Cambridgeshire M.C.C. was decided by a hill-climb on formula, in which Mr. King gained the gold, Mr. Wilson the silver, and Mr. Wallis the bronze medals. After the hill-climb there was a speed-judging contest for motor bicycles and tricars, in which Mr. P. W. Cowell took first prize, and Messrs. Peters and Wallis tied for second place. For August 20th a picnic in the park at Hardwick has been organised, to be followed by a programme of sports. Members intending to be present at the picnic should inform the secretary not later than August 18th.

Sunderland and District M.C.C.

A speed-judging contest was decided on Wednesday, July 29th. The course laid was from High Barnes, Sunderland, to Chester Bridge, Chester, and Framwellgate Moor, returning *via* Cocker Bridge to High Barnes—a distance of twenty-six miles. Each competitor said the speed at which he would travel, and the merit of his performance was judged upon the estimated and actual time he took to cover the circular course. Details: V. Tiffin (car), set 17 miles an hour, actual 17.4 miles; E. J. Scott (2½ h.p. Minerva), 18 miles, actual 20; J. Kirton (¾ h.p. Minerva), 18 miles, actual 20.6; R. Herron (¾ h.p. Minerva), 18 miles, actual 20.8; W. F. Cross (¾ h.p. Minerva), 18, actual 20.8; E. J. Tiffin (7-8

h.p. Minerva), with sidecar carrying passenger, retired owing to a puncture; T. Jameson (4 h.p. Bat-Stevens), retired.

Newcastle and District M.C.C.

On the 26th ult. at Chatton, near Wooler, this club held a petrol consumption trial. Distance and time being fixed, Total weight in pounds winner was to be found from formula

Petrol in ounces.

Eleven machines started, but all were disqualified for being wrong on time except Mr. Robson Crosier on his ¾ h.p. N.S.U. two-speed, his figure of merit being 49.3.

The entries for the 420 miles reliability trial for the N.S.U. Cup on August 2nd and 3rd were: V. Corbett (½ h.p. N.S.U.), H. Bell (4 h.p. N.S.U.), W. H. Outwin (¾ h.p. Triumph), S. W. Carty (¾ h.p. N.S.U.), R. Crosier (¾ h.p. N.S.U.), R. Ellis (¾ h.p. Rex), G. S. Walker (¾ h.p. F.D.W.), L. Austin (¾ h.p. N.S.U.), R. L. Keene (¾ h.p. Triumph), F. Mallett (6 h.p. N.S.U.), D. Mallett (4 h.p. N.S.U.), J. Moule (¾ h.p. N.S.U.), E. L. Bates (½ h.p. N.S.U.), S. Hudson (¾ h.p. Hobart), L. Rosenvinge (¾ h.p. N.S.U.), A. D. Nicholson (9 h.p. Riley tricar), Capt. Sir R. K. Arbuthnot, R.N. (¾ h.p. Triumph), A. Fenwick (5 h.p. Vindec), J. E. Reed (¾ h.p. Rover), H. Bradford (6 h.p. Dene), R. B. Smith (6 h.p. N.S.U.), R. Embleton (¾ h.p. N.S.U.), R. Wilson (4 h.p. N.S.U.), G. Dyson (¾ h.p. Triumph), J. Snowden (¾ h.p. N.S.U.), J. Gilchrist (¾ h.p. Kerry), K. Reinhart (¾ h.p. N.S.U.), and G. Raper (6 h.p. N.S.U.) The results will be announced next week.

A.C.U. END-TO-END RELIABILITY TRIALS. COMPLETE LIST OF AWARDS.

THE committee of the Auto Cycle Union has confirmed the recommendations of the judges (Messrs. Brooker, Cove, Reynolds, and Sharp), and made the following awards:

Gold medals, no marks lost. Private owners.—A. F. Wilding (6 h.p. Bat-Jap), J. Tassell, A. M. Tatham (¾ h.p. Matchless-Japs), S. W. Carty (¾ h.p. N.S.U. two-speed), A. D. Nicholson, Gordon Gibson, F. Dover, F. C. Mustard, C. E. Murphy, R. W. Duke, H. C. Hanrott, A. Manning-Lomax, H. H. Dommett, Robert King, Sir R. K. Arbuthnot, Bart., R.N., W. F. Merritt, J. Ewing Adam, H. D. Seale (¾ h.p. Triumphs), H. R. Dougal (5 h.p. Vindec), and J. Haslam (¾ h.p. Rex).

Gold medals, marks lost. Private owners.—F. S. Barnwell (¾ h.p. Rex two-speed), 79 marks; W. H. Outwin (¾ h.p. Triumph), 8 marks; A. H. Ormerod (5 h.p. four-cylinder F.N.), 10 marks; T. K. Hastings (5 h.p. Indian), 17 marks; W. Milnes (¾ h.p. Phelon-Moore two-speed), 13 marks; and H. B. Lewis (¾ h.p. Triumph), 11 marks.

Gold medals, no marks lost. Trade competitors.—W. H. Wells (5 h.p. Vindec), M. Geiger (6 h.p. N.S.U.), G. Lee Evans (¾ h.p. Rex), J. Slaughter, J. Marshall, P. H. Cockcroft (¾ h.p. Triumphs), R. Moore (¾ h.p. Phelon and Moore two-speed), and C. A. Palmer (5 h.p. Roc two-speed).

Gold medals, marks lost. Trade competitors.—F. W. Applebee (5 h.p. Rex), 7 marks; and O. C. Godfrey (¾ h.p. Rex), 18 marks.

Silver medals, marks lost. Private owners.—E. Gwynne (5 h.p. Vindec), 125 marks.

Silver medals, marks lost. Trade competitors.—A. J. Sproston (5 h.p. Rex), 195 marks; and F. W. Barnes (¾ h.p. Zenette, variable gear), 92 marks.

Bronze medals. Private competitors finishing the journey.—M. W. Randle (10 h.p. Lagonda), E. Nelson (5 h.p. Rex), H. R. Mayo (5 h.p. Vindec two-speed), Miss Muriel Hind (5 h.p. Rex), Rev. L. Cutler (¾ h.p. Triumph), A. D. E. Craig (5 h.p. four-cylinder F.N.), and J. O. M. Dixon (¾ h.p. Vindec two-speed).

Bronze medals. Trade competitors finishing the journey.—G. L. Fletcher (2 h.p. Moto-Rêve) and J. V. Robinson (1¼ h.p. Motosacoche).

Special Prizes.

The Motor Cycle medals.—Passenger class: M. W. Randle (10 h.p. Lagonda). Bicycle class: F. C. Mustard (¾ h.p. T.T. Triumph).

Mr. Wells's prize.—H. R. Dougal (5 h.p. Vindec).

Mr. Cove's prize.—A. F. Wilding (6 h.p. Bat-Jap).

Mr. Reynolds's prize.—Divided between H. H. Dommett (¾ h.p. Triumph) and Dr. H. R. Mayo (5 h.p. Vindec two-speed).

Mr. A. J. Wilson's prize.—J. V. Robinson (1¼ h.p. Motosacoche).

Best performance of trade competitor.—W. H. Wells (5 h.p. Vindec), J. Marshall (¾ h.p. T.T. Triumph), and R. Moore (¾ h.p. Phelon and Moore). The performances of these three riders were so equal that the judges were unable to differentiate between them, and therefore the prize has been divided.

(None of these last three machines had pedals.)

Mr. S. W. Carty writes that, in addition to having a Continental non-slipping tyre on the back wheel of his ¾ h.p. N.S.U. in the above trials, he also had a Continental tyre on the front wheel, and they behaved splendidly.

Phelon and Moore write: "We notice in last week's issue of *The Motor Cycle*, in 'The Results of the End-to-end at a Glance' table, you remark that R. Moore's machine and tyres were in excellent condition, tyre replaced. In fairness to the Palmer Tyre, Ltd., we shall be pleased if you will correct this, as the machine ridden by our Mr. Moore ran through without a single puncture, and his only tyre trouble was due to the butted end of the Michelin inner tube giving way at the joint, and this had to be replaced with a new one."

Mr. W. Williamson writes: "I notice you state that Evans on a ¾ h.p. Rex changed a tyre. I should be obliged if you would correct this, as Evans tells me he had no trouble whatever with tyres. Perhaps under the circumstances it would be only fair to state that he rode Continental tyres."

H. and A. Dufaux (England), Ltd., write: "We think it would have been only fair to state that the broken crank and locked free-wheel (mentioned in the tabulated results, pages 600-602) were caused through a collision with a cart, within six miles of the finish."

Other things being equal—the man with two speeds has the most comfortable time.”—From “End-to-end Impressions.” By B. H. Davies

The **ROC** has come to the front by its truly wonderful clutch and gear system with hand starting. No other machine is capable of quite the same remarkable control and climbing power. Booklet describes the 4 h.p. Royal Military Model—low built—with these and other excellent features. Write the makers—

A. W. WALL, Ltd., Roc Motor Cycle Works, BIRMINGHAM.

A Clever Salesman

may make you believe that black is white—whilst he is speaking—but **no amount of talking** will ever make a motor bicycle with rigid frame as free from vibration as a spring frame machine, scientifically designed, *i.e.*, not one with just spring forks or spring saddle pillar.

No amount of talking can render the ordinary design free from the nerve worrying risk of side-slip directly the roads get at all greasy.

No amount of talking will convince a practical engineer that the ordinary diamond-frame pattern, admittedly perfect for push cycling, is the ideal pattern for a motor cycle with an extra 100 lb. or so of machinery, on which the road shocks encountered are of an entirely different nature.

No amount of talking can possibly describe the general excellence—the marvellous comfort—the absolute luxury of the two spring-frame machines shown below, about the many merits of which riders are unanimously enthusiastic.

THE ZENITH BIGAR. 3½ h.p., Price 43 guineas nett cash.

“THE ZENETTE.” Price 50 gns., including the marvellous “Gradua” gear.

The marvellous “Gradua” infinite change-speed gear gives any gear from free-engine to 3½ to 1 by a simple turn of a wheel.

“The Motor Cycle” (12th Feb.) says: “We are delighted with the way the gear behaved on Muswell Hill. It started the machine from a standstill and enabled the hill to be climbed without a falter.”

“The Motor Cycle” (19th Feb.) says: “During the time the machine was in our hands the gear did everything which is claimed for it.”

“The Motor Cycle” (8th April) says: (re Cudham Hill Climb) re the “Zenette” (fitted with “Gradua”) “though it came up slowly it did so in good form, the variable gear working faultlessly.”

“The Motor Cycle” (15th April) says: “It was the first time this variable gear had appeared in competition, and it behaved admirably. I am sure that Barnes’s performance impressed any prospective motor cyclists that may have been present, more than the wild rush of other machines which leapt about on the uneven surface of the road in a manner calculated to frighten rather than please.”

A “Zenette” fitted with Gradua gear is on view at The Service Co., Ltd., 292, High Holborn, W.C., also at Scottish National Exhibition, Edinburgh.

ZENITH MOTORS, LTD., 101a, STROUD GREEN ROAD, LONDON, N. (Station—Finsbury Park.) Trial runs by appointment ONLY.

In answering either of these advertisements it is desirable that you mention “The Motor Cycle.”

The Service Co., Ltd.

can meet your requirements and assist you out of your difficulties, and the experience of our experts is always at your service. We carry a large stock of new and second-hand machines and owing to our contracts can give prompt delivery of most makes.

L.M.C.

The price of this machine, 3½ h.p. Magneto, is **45 guineas**—your old machine taken in part exchange and extended payments arranged.

TRIUMPH

Latest Model fitted with Clincher Non-Skid Tyre, price **£48**. Exchange and extended payments arranged.

REX

Prompt delivery of all models. Prices from **25 guineas**, fitted with magneto ignition. Our exchange system applies to this.

In addition to the above, N.S.U., Vindec, F.N., Phelon and Moores, Minervas, Phanomen, and all other leading makes our system of exchange and extended payments apply.

Second-hand Stock.

Write for latest list of bargains and state your requirements fully.

Good class up-to-date motor cycles purchased for cash or sold on commission. No sale, no charge for commission made.

Sidcars are one of our specialities. We have had experience with the leading makes. We can assist you in selecting the most suitable for your requirements. Prices from £8 8s. 0d.

ACCESSORIES.

We are informed by our numerous clients that we have the best and most varied selection. Call and judge for yourselves if this is true.

Gear Transmission.

[3454.]—In answer to 3432, I should like to state my experience of gear transmission. Returning from Sutton Bank on the occasion of the hill-climb there, one of the cogs in the transmission broke. A week after I sent the shaft to the agents for my machine, and am still patiently awaiting its return. Fancy, two months of the best part of the year and the machine lying an inert and useless article in the shed. Had it been belt driven I could have repaired the defect by means of the many excellent fasteners on the market in a few minutes. I think it is fortunate for the many users of the motor cycle that most makers have stuck religiously to the belt transmission. PROOF.

Converting to Magneto Ignition.

[3455.]—Having a motor cycle, the ignition of which is by accumulator and trembler coil, I have been wondering if it would be possible to wind the armature of a low-tension magneto to give low enough voltage and ampèreage enough to take the place of the accumulators. If so, could any reader give dimensions of magnets and size and quantity of wire to be wound on armature, and if it would be necessary to run the electricity into commutators, or if an alternating current would work coil? I am inclined to believe that this would interest a great number of motor cyclists, who, like myself, are mechanics, and would like to dispense with their accumulators. It would also open up an interesting discussion through the medium of your valuable paper.

H. G. KING.

Handlebars working Loose.

[3456.]—Re letter No. 3413, to do away with the ball-head clip in favour of a locked stem would, I am sure, only create new troubles for the motor cyclist. For every one clip giving way there are a hundred side-slips, and riders know what a fall would mean to the handle-bars with a locked stem. It would be a case of being stranded with a broken or badly bent handle-bar. Let me have a good fitting handle-bar stem—one that requires considerable force to work it down into position—and a good clip, and I do not fear disaster from that quarter, because if the clip did become useless, the stem would still be tight enough to steer the machine, and in most cases would gradually work round and warn the rider in time. Also, in case of a fall there is not the same shock to the machine when falling on handle-bars that turn in the fork stem, as there would be with locked handle-bar, and the bars can be straightened in a few minutes. FRED WHITTAKER.

Belts and their Fasteners.

[3457.]—In my past experience as a motor cyclist I have often had reason to lament the ease with which the average belt fastener pulls through the average rubber and canvas belt. Judging from reference to this trouble being made so frequently in your columns, one would infer that other motor cyclists experience the same trouble. That being so, the following useful hint, which I received from a friendly reader of *The Motor Cycle* some two years ago, may be of interest. I think all who have tried canvas and rubber belts will admit that the points of attachment of the belt fastener are the weak spots. There the belt has to withstand the greatest amount of wear and strain. The question is, How can one strengthen it there? Well, my plan is this: Take a strip of leather, tough and flexible—e.g., a bit of an old razor strap—lay it over the end of the belt in such a way that the screw of fastener passes through two layers of leather as well as the rubber and canvas belt. Let the strip of leather be long enough to extend a good two inches from the belt fastener; then bind it securely to the belt with tough fine whip-cord (or waxed thread).

It is a good dodge to make the lower part of the leather strip rather wider than the lower surface of belt. By this you secure the protection of a leather surface for your rubber belt just where it is pinched by the belt fastener.

When complete the thing may look a bit clumsy, but I can assure you that it is a most efficient plan of prolonging the life of the belt. I have had reason for gratitude to the friendly motor cyclist who let me have the "tip."

Someone may ask, "How do you manage when it is necessary to shorten your belt on the road? Do you then go through all this lengthy business of leather-guarding your belt?" In reply, I would say that I use a belt made in two sections of very unequal length. Both ends of each bit are strengthened as above detailed. Then in my kit are two or three short bits of various lengths, all duly "leathered." Then Simplex (hook) fasteners make the job of a temporary shortening of the belt an easy one.

Regarding the remarks of "Jupiter" in a recent issue about the fasteners made by Mr. S. T. Robson, of Birmingham, I can heartily agree with the same.

I have used one on a heavy leather belt for over 3,000 miles, and the Vulcan fastener appears good for at least another 3,000. And a friend of mine who uses a big twin with sidecar is as fairly convinced as myself of the merits of the same fitment. I have no personal interest whatever in recommending the Vulcan fastener. A.B.C.

Hill-climbing.

[3458.]—I see in your issue of July 1st that a Mr. Allan Barker states that he has not heard of a motor cycle ever having been ridden up Clay Bank. I enclose you a photograph taken of me ascending the hill in the early part of this year. While touring in this district we came upon the

hill unexpectedly, and I was successful in riding up. Some of my companions doubted this, as they did not get to the top, so I descended and again rode up the hill on my 6 h.p. N.S.U., while one of my companions took the accompanying snap shot. Your correspondent in the issue of the 15th is correct when he describes the condition of the road, as it is impossible to remain seated. GEO. W. RAPER.

How "The Motor Cycle" is Delivered in India.

[3459.]-The enclosed photograph is that of the old Indian postman who usually brings me my copies of *The Motor Cycle*. I thought his picture would interest your readers. He has, however, neglected me lately by not delivering those dated 10/6/08 and 15/4/08. C. HOLLAND.
Calcutta.

The Motor Cycle Tourist Trophy Race.

[3460.]-The A.C.U. seems to be altogether wrong in making the entry fee for private owners in the above race as high as £5, or the same as for trade competitors. It is nothing more or less than a means of debarring we amateurs from a race which should be really confined to us alone. What do the purchasers of machines want? To see what special men on special machines (both generally as light as the proverbial feather) or what our fellow brethren on standard machines like our own can do?

The manager of one of our largest and most successful firms told me that he would not mind if his trade entries cost him £10 each man, so long as amateurs were only charged a nominal fee—say £1. He said what his firm wants is to see what amateurs on standard machines can do; he already knows what his own men can do.

Apart from the above, very few amateurs can afford to pay the exorbitant entry fee demanded, as well as the other expenses, almost exclusively for the sake of the manufacturer of his machine. Very few amateurs' pockets are as deep as those of a successful manufacturer. This may be seen from the paucity of entries received from amateur riders for the above race, and it is not because amateurs are not keen on riding, for I personally know of half a dozen who would enter but for the exorbitant entry fee.

It would certainly be a pity to abandon the only race we motor cyclists have, but judging from the number of entries received compared with last year—due no doubt to the fee—it looks like being a farce, and a total failure.

It is too late this year to amend things, but cannot the A.C.U. be induced to alter its seemingly unpopular action this year, to let us ride next year, and make it the one event to which all keen amateurs look forward. I do not wish to criticise the A.C.U. too harshly, for we should all be proud of having such a well-governed and well-organised body which really caters for the motor cyclist. All my connections with it have been most pleasant.

A. MANNING LOMAX.

More Efficient Lubrication.

[3461.]-Ever since the invention of the motor cycle rapid improvement has been and is still being made in every detail of the bicycle work with exception of the means whereby motor cyclists can lubricate the bearings of the wheels, sprocket, etc., efficiently and without trouble and physical exertion. Might I ask why experienced makers still continue to provide us with only one inlet (and that in the very middle of the wheel hubs) for lubricating, instead of a more logical inlet at each extreme end of the hubs which would allow oil to drip directly into the bearings?

By the former method (one inlet in middle of hub), in order to lubricate wheel bearings thoroughly (those who appreciate a sweet running machine are always particular that this is done thoroughly), it is necessary to squeeze the oil can at least three or four times (an unnecessary waste of oil), and then lean the machine over to whichever side of the wheel it is desired to oil first (no easy matter with a heavyweight motor cycle). This performance has then to be repeated in order to dose the opposite bearing, and so it is obviously necessary to repeat the performance four times whenever the wheels require perfect lubrication. When the makers are kind enough to provide us with two inlets for each hub, it will be necessary merely to insert the nozzle, and give one squeeze for each side, and the bearing will then be thoroughly oiled; nor shall we deposit most of the oil on the inside of the hub barrel, as must more often than not be the case judging by the way I have seen some lubricate (?) the wheel bearings.

HUBERT SALLMANN.

Silence.

[3462.]-I notice a letter in a recent issue regarding silencers. Might I suggest that your columns be thrown open to thresh out this subject. In my own experience I find that it is the noise that causes nervous fatigue on long runs. The silencers on most machines are mere apologies, the main idea seemingly being to keep them as light and small as possible.

I give an instance of result of correspondence with makers of special silencers. My machine is the excellent N.S.U. $3\frac{1}{2}$ h.p. I wrote to one of the firms advertising in your columns, and asked them if they would send a silencer on approval to the manager of the N.S.U. depot here (Edinburgh), I being guarantee for it, to see if it could be easily fitted. Result, no reply. I wrote to another well-known firm. They wished to replace the entire exhaust pipe, though the exhaust box on the N.S.U. is most simply attached to the frame. When will makers see to it that their silencers can be made to readily suit well-known motor cycles? The popularity of the sport would be greatly enhanced if the exhaust were quietened.

Perhaps some would be glad to know that the Brooks B105 compound spring saddle is a revelation regarding vibration compared with ordinary compression springs on most saddles. It absorbs vibration without bouncing.

S 823, EDINBURGH.

[3463.]-With reference to "Silent's" letter [No. 3437], I am pleased to say I am the lucky possessor of a Singer gear-driven motor bicycle, and although I have heard a good deal said against this make of machine, personally I cannot see much to find fault with, and I have yet to experience my first mechanical trouble.

I may say that out of curiosity I took a large portion of my machine to pieces, including the magneto, and by carefully following the instructions in "Motor Cycles and How to Manage Them," together with the valuable hints that are given in *The Motor Cycle*, I have succeeded in putting it in first-rate order, which I consider is rather a delicate undertaking for a novice.

I should be delighted to see a letter published in your valuable weekly (wish it was daily) giving riders' experiences of these machines, and it would thus make *The Motor Cycle* all the more dear to us "Singer" motor cyclists.

SONGSTER.

Fair Treatment.

[3464.]-I have read several letters lately in your splendid paper stating how the public are treated by some motor cycle makers of this country, and I want you to be so good as to publish how well I have been treated by the Rex Motor Manufacturing Co., Ltd.

About four months ago I purchased a twin Rex de Luxe with Roc clutch and twin wheel. The motor cycle is all that one could desire, but the tyres turned out badly, and as the Rex people do not guarantee other makers' goods, I wrote and sent one of the back wheel covers to the tyre makers, who are one of the largest makers in Great Britain. Seven days after I had a reply that they had received the cover, but could not do anything for me, and that I should notify the makers of my machine, so with that I wrote the Rex people about them, and they told me to send the cover to them. This I did, after having to wait for it about three weeks. The makers of the cover said they knew nothing about it until I sent them the number of their letter, and even then I had to wait about a week before I received it. When the Rex people saw it, and knew I was not satisfied with the covers, all the three having turned out badly, they offered me Special Continental covers at about the price of one cover. I accepted their offer, and received the new covers within a week. Not bad treatment that?

About a week ago I had the misfortune to have my inlet valve break, and the valve head fell inside the cylinder, and the top of the piston had a hole knocked clean through it, the valve head being stuck in the top of the piston just like a penny in a slot. I wrote and sent the broken piston and valve to the Rex people and said that I would like them replaced free of charge. In less than a week I received a new piston and gudgeon pin and new inlet valve.

I have no interest whatever in the Rex Co., and I have written this with the sole thought of giving praise where it is due.

WM. WILSON.

Attacks from Dogs.

[3465.]—I have during the past six weeks been twice bitten by dogs, the first time on June 16th, and again a few days ago whilst motor cycling in Anerley I was again attacked and had my ankle bitten.

As I understand a dog is allowed a first bite, I cannot do anything myself. However, I informed the police, and they promised to report the matter, but in the event of another motor cyclist being bitten by this dog, I shall be very pleased to prove a "previous conviction." The owner is a green-grocer in Oakfield Road, Anerley, and when I told him of what had occurred I was informed that it could not be helped, as the dog had never been known to bite anyone before. I feel that the dog question is a very serious one, as bad accidents may be caused thereby.

I may mention that I have been a constant reader for the last three years, and always look forward to Wednesdays because of the fresh number.

MAURICE R. STACEY.

Front Wheel Stands.

[3466.]—Much interest is being taken in front wheel stands just now. "Ixion" in his "Occasional Comments" of June 24th says: "If an extra carrier is not desired, it seems to me that the best device is a stumpy hinged support under the front of the engine crank case."

When a puncture occurs in the front tyre you do not want the front wheel to wobble and revolve in the ball head, you

J. V. Robinson on his End-to-end $1\frac{1}{2}$ h.p. Motosacoche. This rider gained the highest award obtained by any rider of a lightweight motor bicycle in the A.C.U. Six Days' Trials. Other successes by Mr. Robinson on the same machine are, first class certificate for non-stop run in the A.C.U. Quarterly Trials, and a gold medal in this year's M.C.C. London-Edinburgh twenty-four hours' run.

want to feel something as it were holding against you, something to hold the front wheel firm while taking off and putting on cover. In another sentence he says: "The point is that every rider should be able to procure a front wheel stand from stock to fit his machine, instead of, as at present, having to get one specially made."

I think every machine ought to be sent out by the makers complete with these very necessary fitments, and am of opinion that the firms who are going to be most popular and do most business are those that send their machines out with the least possible trouble to the rider and the fewest fitments to buy. The little things are grand for the salesman to talk about and good selling points.

In commenting on the End-to-end run, one of your contemporaries comments on the number of Triumph machines

entered and their appearance. That is a point manufacturers should keep before them. A design pleasing to the eye, a design that gives the machine a spick and span appearance. My machine is a $3\frac{1}{2}$ h.p. Rex, 1907 model, black finish; it has the most spick and span appearance of any model ever turned out by the Rex Co. When I got it it had neither back or front wheel stand, nor tools. Now I have a very simple stand, which is interchangeable, fits either back or front wheel, but I had to devise it and get it specially made. With slight modifications it could easily be fitted to any make of machine, and the stand proper bought at any agents for very little.

J. BAXTER.

Trouble with a Pin.

[3467.]—A puncture? No! A chronic misfiring came on, and I stopped dead on a hill. I could find no fault in plug, engine, or carburetter. In desperation I looked to see if it was water I had in my tank instead of petrol. In undoing the filler cap I heard a hiss. Then I knew. I carried a pin in the vent hole of cap, which had apparently ground itself in and made tank airtight. I left Mr. Pin in the country where no motor cyclist's tyre will pick him up.

E. J. C. H.

A Problem to be Solved.

[3468.]—In reference to Mr. Ovington's letter, in which he tells us of the "abnormal state" into which his four-cylinder F.N. gets, I have had a very similar experience on a locally built machine with a $2\frac{1}{2}$ h.p. Givaudan engine. It is well known that these are very high-speed engines, the bore and stroke being 68×72 . When I first had the machine three years ago, I geared it $4\frac{1}{2}$ to 1. With this gear it climbed most hills without pedalling, and for some time I used it with this gear. Lastly, however, I geared it 6 to 1, so as to be sure of climbing anything. I also altered the carburetter—a F.N.—so as to get a large supply of air when necessary. Soon after making this alteration, I found that with full gas and full air it would "take the bit between its teeth" and tear away at about 40 m.p.h., the engine gradually accelerating all the time. I was always afraid to let it do this on the level for any distance, as I thought something would break inside, the speed of the engine being terrific. All steep hills I used to "rush" in this way, and if I got it into this "abnormal state" at the bottom of a hill, it would go up almost without slowing down.

As regards lubrication, I never used to flood it with oil; one pumpful every fifteen to twenty miles was usual. The phenomenon I attribute entirely to suitable gear and perfect carburation, and I think the majority of modern machines, if geared lower, would not only climb better, of course, but be faster on the level, owing to the engine being allowed to reach its normal speed.

S. H. CROW.

SUMMARY OF OTHER CORRESPONDENCE.

"Xtas" has designed a three-speed gear suitable for fitting on the engine-shaft in place of the ordinary pulley, which will give ratios of about $3\frac{1}{2}$ -1, 7-1, and 12-1, with a 19in. belt rim. He would like readers to inform him if there is any demand for such a gear.

EXPERIENCES WANTED.

"G. L. M." would like readers' experiences with Miraculum or Elastes for motor cycle tyres on a touring machine of 5 h.p.

"G. H. S." (Ashton-under-Lyne) would like readers' experiences with the Cowey speedometer for motor bicycles.

"A. D." (Gloucester) would like readers' experiences with the 1906 pattern Quadrant carette, $5\frac{1}{2}$ h.p. He is troubled with overheating and excessive petrol consumption. Engines will not fire except with 5 spray and 16 cone; Longuemare carburetter. The sparking plugs are useless after about twenty-five to thirty miles—not burnt out, but they will only spark at intervals.

How "The Motor Cycle" is Delivered in India.

[3459.]-The enclosed photograph is that of the old Indian postman who usually brings me my copies of *The Motor Cycle*. I thought his picture would interest your readers. He has, however, neglected me lately by not delivering those dated 10/6/08 and 15/4/08. C. HOLLAND.
Calcutta.

The Motor Cycle Tourist Trophy Race.

[3460.]-The A.C.U. seems to be altogether wrong in making the entry fee for private owners in the above race as high as £5, or the same as for trade competitors. It is nothing more or less than a means of debarring we amateurs from a race which should be really confined to us alone. What do the purchasers of machines want? To see what special men on special machines (both generally as light as the proverbial feather) or what our fellow brethren on standard machines like our own can do?

The manager of one of our largest and most successful firms told me that he would not mind if his trade entries cost him £10 each man, so long as amateurs were only charged a nominal fee—say £1. He said what his firm wants is to see what amateurs on standard machines can do; he already knows what his own men can do.

Apart from the above, very few amateurs can afford to pay the exorbitant entry fee demanded, as well as the other expenses, almost exclusively for the sake of the manufacturer of his machine. Very few amateurs' pockets are as deep as those of a successful manufacturer. This may be seen from the paucity of entries received from amateur riders for the above race, and it is not because amateurs are not keen on riding, for I personally know of half a dozen who would enter but for the exorbitant entry fee.

It would certainly be a pity to abandon the only race we motor cyclists have, but judging from the number of entries received compared with last year—due no doubt to the fee—it looks like being a farce, and a total failure.

It is too late this year to amend things, but cannot the A.C.U. be induced to alter its seemingly unpopular action this year, to let us ride next year, and make it the one event to which all keen amateurs look forward. I do not wish to criticise the A.C.U. too harshly, for we should all be proud of having such a well-governed and well-organised body which really caters for the motor cyclist. All my connections with it have been most pleasant.

A. MANNING LOMAX.

More Efficient Lubrication.

[3461.]-Ever since the invention of the motor cycle rapid improvement has been and is still being made in every detail of the bicycle work with exception of the means whereby motor cyclists can lubricate the bearings of the wheels, sprocket, etc., efficiently and without trouble and physical exertion. Might I ask why experienced makers still continue to provide us with only one inlet (and that in the very middle of the wheel hubs) for lubricating, instead of a more logical inlet at each extreme end of the hubs which would allow oil to drip directly into the bearings?

By the former method (one inlet in middle of hub), in order to lubricate wheel bearings thoroughly (those who appreciate a sweet running machine are always particular that this is done thoroughly), it is necessary to squeeze the oil can at least three or four times (an unnecessary waste of oil), and then lean the machine over to whichever side of the wheel it is desired to oil first (no easy matter with a heavyweight motor cycle). This performance has then to be repeated in order to dose the opposite bearing, and so it is obviously necessary to repeat the performance four times whenever the wheels require perfect lubrication. When the makers are kind enough to provide us with two inlets for each hub, it will be necessary merely to insert the nozzle, and give one squeeze for each side, and the bearing will then be thoroughly oiled; nor shall we deposit most of the oil on the inside of the hub barrel, as must more often than not be the case judging by the way I have seen some lubricate (?) the wheel bearings.

HUBERT SALLMANN.

Silence.

[3462.]-I notice a letter in a recent issue regarding silencers. Might I suggest that your columns be thrown open to thresh out this subject. In my own experience I find that it is the noise that causes nervous fatigue on long runs. The silencers on most machines are mere apologies, the main idea seemingly being to keep them as light and small as possible.

I give an instance of result of correspondence with makers of special silencers. My machine is the excellent N.S.U. $3\frac{1}{2}$ h.p. I wrote to one of the firms advertising in your columns, and asked them if they would send a silencer on approval to the manager of the N.S.U. depot here (Edinburgh), I being guarantee for it, to see if it could be easily fitted. Result, no reply. I wrote to another well-known firm. They wished to replace the entire exhaust pipe, though the exhaust box on the N.S.U. is most simply attached to the frame. When will makers see to it that their silencers can be made to readily suit well-known motor cycles? The popularity of the sport would be greatly enhanced if the exhaust were quietened.

Perhaps some would be glad to know that the Brooks B105 compound spring saddle is a revelation regarding vibration compared with ordinary compression springs on most saddles. It absorbs vibration without bouncing.

S 823, EDINBURGH.

[3463.]-With reference to "Silent's" letter [No. 3437], I am pleased to say I am the lucky possessor of a Singer gear-driven motor bicycle, and although I have heard a good deal said against this make of machine, personally I cannot see much to find fault with, and I have yet to experience my first mechanical trouble.

I may say that out of curiosity I took a large portion of my machine to pieces, including the magneto, and by carefully following the instructions in "Motor Cycles and How to Manage Them," together with the valuable hints that are given in *The Motor Cycle*, I have succeeded in putting it in first-rate order, which I consider is rather a delicate undertaking for a novice.

I should be delighted to see a letter published in your valuable weekly (wish it was daily) giving riders' experiences of these machines, and it would thus make *The Motor Cycle* all the more dear to us "Singer" motor cyclists.

SONGSTER.

Fair Treatment.

[3464.]-I have read several letters lately in your splendid paper stating how the public are treated by some motor cycle makers of this country, and I want you to be so good as to publish how well I have been treated by the Rex Motor Manufacturing Co., Ltd.

About four months ago I purchased a twin Rex de Luxe with Roc clutch and twin wheel. The motor cycle is all that one could desire, but the tyres turned out badly, and as the Rex people do not guarantee other makers' goods, I wrote and sent one of the back wheel covers to the tyre makers, who are one of the largest makers in Great Britain. Seven days after I had a reply that they had received the cover, but could not do anything for me, and that I should notify the makers of my machine, so with that I wrote the Rex people about them, and they told me to send the cover to them. This I did, after having to wait for it about three weeks. The makers of the cover said they knew nothing about it until I sent them the number of their letter, and even then I had to wait about a week before I received it. When the Rex people saw it, and knew I was not satisfied with the covers, all the three having turned out badly, they offered me Special Continental covers at about the price of one cover. I accepted their offer, and received the new covers within a week. Not bad treatment that?

About a week ago I had the misfortune to have my inlet valve break, and the valve head fell inside the cylinder, and the top of the piston had a hole knocked clean through it, the valve head being stuck in the top of the piston just like a penny in a slot. I wrote and sent the broken piston and valve to the Rex people and said that I would like them replaced free of charge. In less than a week I received a new piston and gudgeon pin and new inlet valve.

I have no interest whatever in the Rex Co., and I have written this with the sole thought of giving praise where it is due.

RECENT PATENTS.

By ERIC W. WALFORD, F.C.I.P.A.

A Simple Silencer.

The exhaust is led through the pipe A into the pot C. The outlet holes E allow the gas to pass into the outer chamber, whence they issue by the pipe F. The inventor

states that by making the holes E at the same end of the pot C as the inlet pipe A, high efficiency is obtained.—E. H. Morgan, No. 9,297, 1907.

An Expanding Pulley.

The movable flange B slides upon the hub A¹ of the fixed flange. This hub A¹ has a stationary disc F screwed into it, and to this is attached one end of a coil spring D, the other end of which is attached at D¹ to the movable pulley flange. Thus the two flanges are connected together by a helical spring, and relative rotation is prevented. The object of the invention is not quite clear from the description, as it is not stated in the patent specification.—L. Tanner, No. 18,035, 1907.

An Interesting Engine.

In this very interesting high-speed engine, the piston A reciprocates and also rotates. The rotation is transmitted to the driving-shaft, and the piston A in its rotation acts as a piston valve, uncovering ports in the cylinder C, one of which—D—is shown in one of the drawings. This port D happens to be the inlet port. As will be seen, the piston is conical, and carries a loose ring E attached to the bottom of the piston, this ring being forced outwards by the gas pressures, so that a tight joint is made in the cylinder without the use of piston rings. Cam mechanism, of a somewhat difficult nature to describe, is employed to transmit the rotation of the piston to the driving-shaft. A complete description of the engine cannot be given within the limits of a paragraph, but when it is stated that the engine is the joint invention of Peugeot Frères and Mr. Jules Gobiet (whose articles on high-speed engines appearing in this paper some years ago will be remembered) it can be taken that the construction is of great interest. Its external appearance can be gathered from one of the illustrations to be quite as extraordinary as its operation. It is, of course, understood that it is the inventors' intention to make the engine revolve at a very high number of revolutions per minute.—J. L. T. Gobiet and P. R. and J. Peugeot, No. 7,565, 1907.

A Passenger Attachment.

A seat A is provided for this purpose, and is mounted over the back wheel. It is provided with supports B on both sides of the road wheel, and a connecting bar C. A platform or footrest D is also provided, so that the occupant is fairly comfortably carried.—A. Arendt, No. 25,029, 1907.

An Air Filter.

A moistened pad of absorbent material is the intercepting medium. A casing A having a removable cover B is provided with air inlet apertures C, located at a distance above the base of the casing. D is a supply pipe fitted with a cap for the admission of a supply of liquid to the base of the casing. The air inlet apertures C are protected with a covering of fine gauze E. At the head of the casing two outlet ways F and G are provided—one for connection with a carburetter, the other for connection with a source from which extra air may be drawn as required. Within the casing a frame H is provided, consisting of two grids, between which a pad

of absorbent material K is inserted. The frame is supported upon legs H₁, which rest on the base of the casing, and is fitted with capillary feeders K₁, which may consist of threads depending to the base of the casing for conveying liquid to the material K by capillary action, so as to keep the material moist. The construction permits the frame H and associated parts to be readily removed for cleaning when the cover of the casing is taken off. Absorbent materials of various kinds may be used, but the use of sponge is particularly efficient.—J. D. Macdougald, No. 15,572, 1907.

A MOTOR CYCLE
WEIGHING
ONLY 60 LBS.

A PERFECT
MOTOR CYCLE AT
A BICYCLE PRICE.
£19 19 0 complete.
*Fitted with Ruthardt
Magneto*
£4 10 0 extra.

THIS IS QUITE THE LOWEST PRICE

at which it is possible to obtain an efficient motor cycle. The "Wolf" featherweight motor cycle is no toy—it is a marvel of sound construction and ingenuity, and with a wonderful hill-climbing capacity. The frame is specially built and the whole machine is British made.

THE "WOLF" FEATHERWEIGHT MOTOR CYCLE.

SPECIFICATION.

ENGINE—A. J. Stevens 2½ h.p.; bore 2½ in., stroke 2½ in.
COIL—Fuller.
ACCUMULATOR—Premier.
CARBURETTER—A. J. Steven's automatic air inlet and throttle combined.
BELT—Best Chrome.
JOCKEY PULLEY—Ball Bearing.
FRAME—22 in. and 24 in.
TANK—To which combined petrol, lubricating oil, and coil compartments are fitted.

WHEELS—26 in. or 28 in.
TYRES—Wasp No. 1, 1½ in. diameter. Made specially by the Dunlop Rubber Co., Ltd.
CONTROLS—Valve lifter and ignition are controlled by one lever; when magneto, extra lever for ignition.
HANDLEBAR—Wide raised, to which a switch of neat design is fitted.
BRAKES—Wasp front and back roller or inverted levers.
FINISH—Best black enamel, lined two colours. Olive green, silver lines 10/- extra.

"Wolf" Tyres made by the Dunlop Rubber Co. Ltd., 2 in. to fit any standard 1½ in. rim 20/- extra. Write for lists.

WEARWELL MOTOR CARRIAGE CO., LTD., WOLVERHAMPTON.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.

York and Lancashire.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

SECTION X.

Scotland.

SECTION XI.

Ireland and Isle of Man.

PREMIER MOTOR AGENCY,

Aston Road, BIRMINGHAM.
Telephone: 4310. Telegrams: "Primus," B'ham.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes may be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 2 Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties advised of this receipt, and upon intimation of arrival and acceptance of the goods, the money forwarded less a charge of 1s. for registration. Time allowed for a decision after receipt of the goods three days. For all transactions exceeding £10 value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Liffé & Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive answer to their enquiries are requested to regard silence as an indication that the goods advertised have already been disposed of. Advertisers often receive many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

3 h.p. Quadrant, spring forks, re-enamelled and plated, equal to new throughout thoroughly good hill-climber, and most reliable machine; £12 10s., lowest.—"Quadrant," 86, Colvestone Crescent, Dalston, London.

21 h.p. J.A.P. Motor Cycle, vertical engine torpedo tank, Chater-Lea fittings spray carburettor, low frame, handy, light runabout; splendid bargain, £12 10s., or near offer.—On sale at Wauchope's, 9, Shoe Lane Fleet Street, London.

MOTOR Cycles, with Chater-Lea frames, torpedo tanks, 3½ h.p. Fafnir engines from £25; sidecars built to order, from £18s. 6d.; write us for Chater-Lea frames.—The Ravensbourne Motor Co., Southend, near Catford, S.E.

24 h.p. F.N., flies up hills, engine guaranteed absolutely perfect, low saddle tyres as new, perfectly reliable, no better machine; cash needed; £12, quick sale.—Motorist, 3, New Norfolk Street, Curtain Road, London.

F.N., 2½ h.p., good condition, long and short bars, two accumulators, two belts Dunlops (back unpunctured); £15, or will exchange and pay cash £2 per month for good higher power.—472, The Motor Cycle Offices, Coventry.

1906 Vincdec Special, 3½ h.p., magneto and accumulator ignitions, Truffaut spring forks, practically new throughout guaranteed perfect, romps up terrific gradients, absolutely reliable; £25, lowest.—Motor, 9, French Place, Shoreditch, London.

51 h.p. Rex de Luxe, 1907 model, fitted with twin back tyres and free engine clutch, magneto, sprung back and from very low reach, starts like a car with handle condition throughout is excellent: this machine is for sale at the low price of £22 10s. Wauchope's, 9, Shoe Lane, Fleet Street, London.

BARGAIN.—3½ h.p. Minerva, Chater-Lea frame and fittings, Advance adjustable pulley, new Palmer cord back, extra Stark Continental front, just been thoroughly overhauled and new piston and ring fitted, a splendid hill-climber, in first-class running order; sacrifice, as money wanted £16 10s.—C. Altman, The Lodge, Watford.

1908 3½ h.p. Phoenix Cob, open frame, two speed gear, magneto ignition, starts like a car, gears, chain, and back wheel all covered in, condition of the machine new, it would be suitable for lady or gentleman complete with lamp, horn, and spares; price £32 10s., exchange arranged.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

5 h.p. M.M.C., 92 mm. bore, Chater-Lea throughout, spring handle-bars and seat-pillar, Fit-all two-speed, handle starting, B26 Longuemare, fitted Gillett-Lehman control, Lloyd's type fan (cost £6), two Lit anode accumulators, Basse-Michel trembler coil, large quantity tools and spares, together with lamp, stand, carrier, etc., perfect order, and finish aluminium, with black lines; price £40 seen by appointment.—Warwick, Willpha, Longlands Park Road Sidecup.

SECTION IX.

Somerset, Devon, Dorset, and Cornwall

FOR Sale, 3½ h.p. Triumph, accumulator ignition; £11 10s.—Matthews, Hammersmith, Merton.

SECTION X.

Scotland.

ANTOINE, 5 h.p., twin, very powerful

REX, 5 h.p., twin, 1907, used for trials; £19 10s.

QUADRANT, 3½ h.p., magneto, spring forks in splendid order; £25.

GRIFFON, 3½ h.p., 1907, spring forks, almost new; £28.

TRICAR, Rex Triette, 5½ h.p., Osborn

three-speed gear, in splendid order

£30.—At Alexander's Motor Exchange,

Lothian Road, Edinburgh.

EDINBURGH Exhibition, Industrial Hall

Stands 126 and 127; finest exhibition

motor cycles ever shown on any one stand

from May till October.—Alexander's Motor

Exchange, Lothian Road.

COUPLINGS.

UNITO Cycle Couplings, for connecting any ordinary pedal cycle to motor cycle.

THE Unito connects the steering and ensures faultless alignment.

THE Unito is so constructed that side strain and lean of machines is entirely viated.

THE Unito is adjustable to accommodate differences in wheelbase and wheel and frame dimensions.

DON'T Buy a Sidecar before you know the advantage of having a

UNITO Coupling. It only costs one guinea.—Write, Dept. B., Unito Coupling Co., Ystrad, Glam.

ENGINES.

1 h.p. Werner Engine, with carburetter, etc.; £2 18s.—D. Sullivan, 40, Hubert Ave, Clapham.

ENGINES.—Zedel and Griffon, 2½ h.p., £7 13s.; 3½ h.p., £9; 3½ h.p. twin, £10 10s.; 5½ h.p., £13 12s.; all models in stock, and spares.—Rey, 5, Heath Street, Hampstead.

h.p. w.c. engine, £6; 6½ h.p. Aster engine, £8 10s.; 8-10 h.p. two-cylinder Brown, £10; 2½ h.p. Clement, 42s.; all in running order and fitted with carburetters.—Motor Exchange, Westgate, Halifax.

1 h.p. Minerva, inclined, £3; 3½ h.p. Standard, vertical, £3 10s.; 3 h.p. Quadrant, 10s.; 1½ h.p. Minerva, 25s.; 3 h.p. Minerva pattern, M.O.V., £3 10s.; 2 h.p. Quadrant, 35s.; h.p. De Dion pattern, 45s.—Farrar, Square Road, Halifax.

TYRES.

BOOTH.—New rubber studded cover, 26 by 2, 25s.; ditto, 26 by 2½, 27s. 6d.

BOOTH.—Peter-Unions, 24 by 2½, 28 by 2½, 15s. 6d.; Royalty covers, 26 by 2, 12s. 6d.; 13s. 6d.

BOOTH.—Ten shillings allowed for old cover in exchange for Shamrocks, Palmers, Goodrich's.

BOOTH.—Tyres, best make, 26 by 2, 16s.; 2½, 17s. 6d.; 2½, 21s.; 28 by 2, 16s. 6d.

BOOTH.—Best tubes, 26 by 2, 7s.; 2½, 7s. 6d.; 2½in., 8s. 6d.; 28 by 2, 7s. 6d.

BOOTH.—All tyres sent on approval.—Booth's Motor Exchange, Wade Street, Halifax.

6 by 3 Dunlop Inner Tube, for car, new; 12s.—Oliver, 154, Fleet Street, London.

MAUDE'S.—Fully guaranteed tubes, 26 by 2in., 6s.; 2½in., 7s.; 2½in., 8s.; 28 by 2, 7s. 6d.; 2½in., 8s.; approval willingly.

MAUDE'S.—Covers, 26 by 2in., 16s.; 2½, 17s. 6d.; 28 by 2in., 17s.; 2½in., 18s.—Maude's, Well Street, Halifax.

MAUDE'S Butt-ended Tubes.—Why not try one on approval? Note especially the low prices: 26in. and 28in. by 2in., 7s. 6d.; 2in. and 28in. by 2½in., 7s. 9d.; 26in. and 28in. by 2½in., 8s. 3d.—Maude's, Powell Street, Halifax.

SPECIAL 2½ Calmon tyres, fit 26 by 2 rims, 17s. 9d. each; other sizes, 15s. each.—Motor Exchange, Westgate, Halifax.

CLINCHERS.—Special 2½in. covers, to fit 2in. or 2½in. rims, 23s. each; don't be under-tyred. It's false economy.—Farrar.

SPECIAL Line.—Climber tubes, 26 by 2, and 28 by 2, complete with valves; 5s. each, post free.—Farrar.

0 Per Cent. off usual prices.—Climber A Won brand new covers, 26 by 2, 18s.; 26 by 2½, £1; 28 by 2½, heavy tricar, £1; 26 by 2, extra heavy, 21s.; 26 by 2½, extra heavy, 22s.; all ribbed non-skid treads.—Farrar.

0 S. Allowed for old covers in exchange for Goodrich, Palmers, Shamrocks.—Farrar, Square Road, Halifax.

REPAIRERS.

5 any motor cycle we cannot repair.—Whites, 22, Brook's Alley, Church Street, Liverpool. Agents for Lubrio.

CRACKED Water Jackets of motors successfully repaired by Lea's metallurgical process.—Lea and Son, engineers, Run-

200 MOTOR CYCLES
To SELECT FROM.

WAUCHOPE'S

THE WORLD'S
LARGEST DEALER

TELEGRAMS OPIFICER, LONDON. TELEPHONE NO. 5777, HOLBORN.

You will be interested if only to view our varied stock of Small Motor Vehicles.

1908 STANDARD TRIUMPH now fitted with non-skid tyre to back wheel, £48. Second-hand motor cycles, light cars, or tricar taken in part payment, good market value allowed by WAUCHOPE'S. Address as above.

1908 MINERVAS.

2½ h.p., £29. 3½ h.p., £32. 4½ h.p., £39. 7-8 h.p., £45.

You can get them at WAUCHOPE'S. Send particulars of your second-hand machine and we will submit price of allowance unseen, subject to machine tallying at sight. Carriage will be paid in one direction by us should we fail to come to terms.

1908 VINDEC SPECIAL.

You can get them at WAUCHOPE'S. Exchanges arranged.

1908 N.S.U.'s.

You can get them at WAUCHOPE'S. Exchanges arranged. Liberal allowance.

1908 F.N., 4-cylinder, 5-6 h.p., £52 10s.
Lightweight F.N., latest model, £35.

You can get them at WAUCHOPE'S, 9, SHOE LANE, FLEET STREET, LONDON.

Second-hand machines will be allowed for in part payment.

1908 Lightweight Ariels, magneto and spring forks, 37 Guineas.

You can get them at WAUCHOPE'S.

WAUCHOPE'S
9, Shoe Lane, Fleet Street, London.

REPAIRERS.

CAR and Motor Cycle Repairs.—Cylinders re-bored, new pistons fitted, gears, bearings, valves, etc.; prompt delivery.—Mastin and Smart, Bedford. Est. 1889.

IGNITION Coils and Magnetos Repaired, any make; accumulators repaired and charged; best work; moderate charges; quotations. — Glover Bros., Electricians, Coventry.

BIRMINGHAM. — Repairs, overhauling, cylinders re-bored, re-bushing, valves, pulleys, any make; ideas carried out; tuning up a speciality; estimates free.—Priest and Williams, 66, Bishop Street.

TO West of England Motorists.—Car and motor cycle repairs, prompt and reliable; cylinders re-bored, new pistons and rings fitted; don't hesitate; send straight to us.—Hamlin, Motor Works, Bridgwater.

REPAIRS and Overhauling. — We have the finest repair works in London for motor cycles, with up-to-date machinery; estimates free; new cylinders for any make of engine, pulleys, valves, gears, and all replacements; send for our new booklets, with prices. — Laystall Motor Engineering Works, 27 and 29, Laystall Street, Rosebery Avenue, E.C.

EXCHANGE.

WANTED, good Motor Cycle Lamp, good condition.—Butler, 26, Guppy Street, Swindon.

TWIN Rex and cash for modern magneto single.—Box 425, The Motor Cycle Offices, Coventry.

WANTED, Good Lightweight, in exchange for new furniture.—Replies, Tibbott, "Manfield," Wrexham.

EXCHANGE lady-back tandem, splendid condition, for motor cycle or piano.—Sturgess, Kintbury, Berks.

WANTED, new 2½ h.p. inclined Jap engine; cheap; approval; deposit.—No. 471, The Motor Cycle Offices, Coventry.

18 CT. Gold Watch, value £15, for 1½, 2, or 3 h.p. motor cycle.—Particulars, Maillard, Gaveston Road, Leamington.

VELOX, 5 h.p., Aster engine, two-seater, cheap, or exchange for motor cycle and cash.—Manning, Burley, Ringwood.

EXCHANGE, 3 h.p. Triumph, in perfect order, for 3½ h.p. 1908 Minerva, with small cash adjustment.—Palmer, 53, Highgate Hill.

5 h.p. Vindec Special (magneto), good condition, for good 3½ h.p. single-cylinder (magneto), Triumph preferred.—Brand, 14, Steyne Street, Bognor, Sussex.

EXCHANGE 3½ h.p. Ariel and 1½ h.p. Crossley gas engine, for up-to-date powerful single or twin motor bike.—Baldwin, 151, High Street, Sutton, Surrey.

8 h.p. Le Dion Engine Car, two seats, detachable third seat; exchange Phelon-Moore or Triumph, cash adjustment.—Wright, 26, Regent Road, Morecambe.

21 h.p. Humber, low, vertical, perfect order (£8 10s.) and phonograph, Edison Gem, and 40 records (£2), for higher power, or sell.—15, Moutrose Street, Darlington.

EXCHANGE, for good motor cycle or tricar, new furniture, any description, valued wholesale, direct from the works.—Furniture manufacturer, 9, French Place, Shore-ditch, London.

TWO-SEATED Pelham Car, 6 h.p. De Dion engine, three speeds and reverse, new condition; cost £160, for Riley, Singer, or first-class tricar and cash adjustment.—A.B., 196, Aldersgate Street, London.

EXCHANGE for cycle and cash, or lower power and cash, 3½ h.p. Humber, perfect engine and tyres like new, magnificent hill-climber, thoroughly reliable.—Stanton, 86, Colvestone Crescent, Dalston, London.

WANTED.

GOOD Sound 28 by 2 beaded cover wanted on approval.—Blanchard, Dorchester.

MONTGOMERY Flexible Sidecar, for left side of 1907 Rex de Luxe, 26in. wheel; will exchange Rudge-Whitworth 12-guinea lady's bike, nearly new.—S. Fraser, 13, Eglington Street, Glasgow.

MATCHLESS MOTORS!!

LONDON TO EDINBURGH: 3 STARTED. 3 FINISHED.

No Trade riders—ridden by private owners only.
"CHASE" DRIVING RIM BRAKE.

No. 1 pattern—back pedalling brake. Machine can be wheeled backwards. Extremely powerful. Price, 16/6, post 17/-.

No. 2 pattern—footrest brake, complete. Price £1 6s. Footrests only. Price 12/-. With either, 1/2 in. or 1 1/2 in. clip, post 12/6.

No. 3 pattern—foot brake with pedal fitted on stud provided, which fixes in place of one of crank case bolts. Price complete 16/6, post 17/-.

MATCHLESS PETROL FILTER.

No choked carburetters.
4/6, post 4/8.

MATCHLESS SPRING FORK ATTACHMENTS.

Converts an old pattern motor cycle into an up-to-date luxurious motor. Thousands in use, giving every satisfaction!!

15/6, post 16/-

THE MATCHLESS SILENCER.

Up to 3 h.p., 10/-; from 3 1/2 to 5 h.p., 12/-. Cut out 5/- extra. Two connections for twins with separate exhaust pipes, 4/- extra.

Catalogues of "Matchless" Motor Cycles and Accessories on application to

(Nearest Station: Woolwich Arsenal.
Telephone: 232 Woolwich.)

WANTED.

WANTED, Old Accumulators; best price given.—Motorics, 3, Arley Grove, Armley, Leeds.

MAGNETO Rex, single-cylinder, for twin Rex and cash.—Box 424, The Motor Cycle Offices, Coventry.

WANTED, 3 1/2 h.p. Motor Cycle for ladyback tandem (£) and £1 monthly.—83, Dennis Road, Eastbourne.

WANTED, Montgomery sidecar, 26in. wheel; state lowest cash.—1, Palmerston Street, Bedford.

WANTED, good late make air-cooled engine, M.O.I.V., not less 3 1/2 h.p.—35, Petre Street, Sheffield.

WANTED, good sidecar, will give gent's 10-guinea pedal cycle, new.—Farrar, Square Road, Halifax.

TRIUMPH wanted, 1906 or 1907, or any other good make; cheap for cash.—Rey, 5, Heath Street, Hampstead.

RICH Tube, 26 by 2 1/2, spring seat-pillar, inch stem, 13-16in. saddle; approval.—Blick, Harbury, Leamington.

£30 Offered for 1908 Magneto 3 1/2 h.p. Phelon-Moore, in new condition; approval, essential.—70, Prince Street, Bristol.

WANTED, new pulley, 3in., 28°, for 2 1/2 h.p. Buchet engine, outside flywheel type.—Write, F.B., 81, Spon End, Coventry.

WANTED, Clincher A Won motor cycle tyre, 28 by 2, extra stout, condition as new.—Cox, Stanford-in-the-Vale, Berks.

CRANKS, chain wheel, for 2 h.p. F.N., 26in. by 2in. wired cover, flat belt rim.—69, Palmerston Street, Moss Side, Manchester.

STOCKPORT.—A quantity of second-hand motor cycles to sell on commission; sold ten in last ten days.—Lund and Davies, Heaton Lane, Stockport.

WANTED to purchase for cash, Triumphs, Quadrants, Minervas, Bats, Japs, Riley and Lagonda tricars, or exchanges arranged for new models.—Wauchope's, 9, Shoe Lane, London, E.C.

WANTED, motor cycle, about 3 1/2 h.p., spring forks, good make, and perfect order, in exchange for £10 cash, oak bureau, and other furnishings.—Harry Dougall, 16, Broughton Place, Edinburgh.

THE Proprietors of the patent rights of R.O.M. synchronised contact breakers are prepared to accept offers for the rights to manufacture in France; write for particulars.—Continental Motor Co., 32, Rosebery Avenue, E.C.

MISCELLANEOUS.

ENGINES Re-bushed throughout from £1.

CYLINDERS Re-bored from 5s.

PISTONS Supplied new from 7s. 6d.

RINGS from 9d.

CONNECTING Rods from 7s. 6d.

AXLES, cranks, spindles, handle-bars, seat-pillars, or any other parts made to pattern or sketch at lowest prices; accuracy guaranteed.—Tufnell and Co., Lightning Motor Works, Leytonstone.

26 by 2 1/2 extra heavy Clincher, week's use, 12s. 6d.; new gilled copper tube radiator, 6 by 4 tubes, 17s. 6d.; 6 h.p. silencer, 10s.—46, Vardens Road, Clapham Junction.

DERMATINE BELTS

HOLD ALL RECORDS.

End-to-End Record, June 9th and 10th :
Mr. A. W. Bentley, using Dermatine belt.
M.C.C. 24 Hours' Ride to Edinburgh,
June 5th and 6th :

35 were successful, using Dermatine belts.
Stadium Race Meeting, June 8th :
Harry Martin, First in Ten Miles Race.

Stadium Race Meeting, June 24th :
Again the First, Second, and Third winners

were fitted with Dermatine belts.
No other belt holds such records. The Original Rubber and Canvas Belt. **BEWARE OF IMITATIONS.** The standard belt that is adopted by all leading manufacturers.

End-to-End Record.

Read the testimonial from the Triumph Co.
Coventry, June 22nd, 1908.
Mr. Stanley Webb, 32, London Road,
Bromley, Kent.

Dear Sir,—I do not know whether we have written to you about the Bentley End-to-End record. Mr. Bentley had a Stanley Dermatine Belt fitted to his motor cycle. It gave him entire satisfaction, and had not to be touched once during the whole ride of 886 miles.

Yours faithfully, M. J. SCHULTE,
Manager Director, Triumph Motor Co., Ltd.

Second season in use, and still going strong.
125, Bunhill Row, E.C., 12/6/08.

Dear Sir,—You will be pleased to hear that the "Dermatine" Belt I used in this year's London-Edinburgh run gave me no trouble whatever, and that, moreover, it was the identical belt I used in last year's L.-E. run. It is still going strong, though having run nearly 3,000 miles. Yours faithfully, J. P. LE GRAND.

800 miles, and no trouble nor once shortened.

Southernhay, Loughton, June 12th, 1908.
Dear Sir,—I must again congratulate you upon your excellent belts, as the one I used on my 3 1/2 Vindec in the Schulte Cup Competition to Edinboro' and back gave me no trouble whatever, and was not even shortened once in 800 miles. I consider this a severe test, and a splendid proof of efficiency.

Yours faithfully, OWEN L. SUMMERS.

Hundreds of Testimonials. British Made.

NOTE THE PRICES.

1/2 in.	3/4 in.	1 in.	1 1/4 in.
1/2	1/4	1/8	1/11 per ft.

POST FREE.

The Stanley Adjustable Fastener.

A long-felt want at last for adjustable pulleys.

Can be used with existing Stanley Fasteners. It is also most useful for starting out with hook fitted, and in case belt slips, to shorten simply take out the hook. Belt shorten 1/2 in.; time, one second.

Price Stanley Fastener, complete with set hooks, 1/6. Set of hooks, separate, price 1/-.

The Stanley Detachable Fastener.

80,000 in use.

With Unbreakable Hook. Guaranteed. (Made under Simplex Patent.) In sizes 1/2 in., 3/4 in., 1 in., 1 1/4 in.—each. Wholesale and Retail.

The STANLEY DERMATINE MOTOR BELT CO.,

Some Points of Interest.

By "IXION."

HAVE had such a plethora of correspondence lately that I am asking the editor to allow me space to work off a few of the replies of some public interest in a batch. One letter is from the owner of a well-known 1908 machine, which has a gudgeon pin of unusual design. It is a good deal shorter than the diameter of the piston, is a loose fit, and is devoid of any fastenings, except that the lowest of the three piston rings crosses the outer ends of the holes in which the gudgeon pin is bedded. Consequently, the gudgeon, even when new, has a certain amount of end-play, and is constantly hitting the lowest piston ring, and snapping it. There are no two opinions about the design—it is as bad in theory as it actually proves in practice. Not only is the ring breakage certain to be, but as the ring wears, it is apt to spring farther out of its groove, and a compression leakage presently pours through the two holes in which the gudgeon pin is so slack a fit. I have advised my correspondent to fit a new and tight gudgeon pin, locked by set screws, which are further to be secured by split pins, and to slot the ends of the pin so that the ring may pass it, and withal have a tight-fitting groove. If there is not sufficient metal in the piston's interior for set screws to be fitted, it will be safest to have an entirely new piston specially made. A really tight-fitting gudgeon pin, without other fastenings than the ends for an encircling piston ring to bed in, has been made to give satisfactory results; but the ring is bound to snap if the gudgeon pin turns ever so little, and consequently it is safer to use an additional locking device.

Another reader is grumbling exceedingly because the oil pumps of the machine he fancies are all fitted on the right-hand side, and he thinks this will be awkward, as he can only steer one-handed with the right hand. Without doubt oil pumps ought to be fitted on the top of the tank, and not screwed low down on to either side of it, as is the case with some machines; for if the plunger handle be on the tank top, it is accessible for either hand at will. However, my correspondent will find a very moderate amount of practice will put him quite at his ease with any placing of the oil pump whatsoever.

A third reader cannot fit a cyclometer, owing to the motion of his spring forks. It is scarcely credible that he cannot find room for it on either side of his back wheel. It is not advisable to use a small push bicycle cyclometer on a motor, but the patterns sold for this special purpose are entirely satisfactory.

A novice writes to know the reason of his engine suddenly "pulling up," as he calls it, while riding, but he gives so few details of its behaviour (it is a 1 1/4 h.p. lightweight) that it is difficult to be sure what is troubling him. The lightweight I ride myself will "pull" up if either the machine be slowed down too much, or if the extra air be left open when the machine is slowed down to ten miles an hour, and in neither case is there any misfiring. His trouble may therefore be that after lifting the valve he drops it again when the machine is going dead slow, and needs a stroke or two of the pedals; or that he has his ignition over advanced for the road speed; or that he is giving too much extra air for the engine speed (in this last case one would

Some Points of Interest.

expect misfiring). If his "pulling up" occurs at fair speeds, in excess of twelve miles an hour, it is due to overheating or temporary stoppage of sparking, or of the petrol supply.

An engineer sends me a particularly useful wrinkle about fitting new rings in lieu of new cylinders when the bore of the cylinders has enlarged. He points out the obvious fact that if a cylinder has worn 2 mm. and new rings are fitted, these rings must be of the original bore, or they will not enter the cylinder at its lowest point where it is probably entirely unworn. Consequently, as the rings are passed up towards the top of the cylinder, where the diameter of the cylinder is enlarged by 2 mm., there will be an oblique gap of no less than 6 mm. if rings with the ordinary sloped cut ends are employed. He has therefore fitted a new set of rings with long step-cut ends, and he finds his compression as good as when the cylinders were new. This is very sound advice, and should be followed by all who endeavour to cheaply atone for worn cylinders by fitting a new set of rings.

Are Big Float Chambers Desirable?

A medical rider sends a plea for big float chambers to the carburetter. He does not say what machine he is riding, but says he has suffered unspeakable things from leaky floats, because his float chamber was excessively small, hence the float was very lightly constructed. As he says, a leaky float is practically unknown on cars, because the chamber is big enough to admit plenty of petrol, and consequently a float with heavily made joints can be fitted. It may interest him to know that in more than ten years of motor cycling I have never once owned nor seen a leaky float, and I think he must have been exceptionally unlucky. I have two very small floats under my notice now, both of which have been running almost daily for four or five years without trouble. He has further been suffering from a very unusual trouble. The symptoms were prolonged incurable irregularity of running of a kind that pointed to petrol starvation. At last he remembered that his petrol tap, being made of very soft stuff, had often been ground in to cure leakage, and on examining it found that the holes in the tap and in the pipes had been put quite out of mutual register by the grindings, so

that he was scarcely getting any spirit through to the carburetter. A new tap barrel, with spring washer, soon remedied the nuisance. I wonder what sort of a shoddy machine this correspondent has got hold of, and am quite certain it is not a standard modern mount.

A well-known Midlands rider sends quite a little batch of interesting experiences. He enclosed a cast-iron headed valve which broke and caused some damage, and from a sketch of the fracture readers will see that the expenditure of a little more time and money in the manufacture of these valves would probably save such fractures in future. The thick part of the stem ought certainly to be bedded in the cast-iron head. I myself have broken several of these valves, and my experience is that the fracture always occurs, as with his, at the point where the screw threading leaves the thick part of the stem. If this thickening of stem were countersunk only $\frac{1}{8}$ in. into the mushroom head, it

would relieve the threaded portion of much of the cross strain from which it suffers at present. His gudgeon pin was worn in a very abnormal fashion. The oil-ways in the gudgeon pin-brass on this engine are spiral, and they had acted as matrices and produced an elevation of similar shape upon the pin. I never heard of a similar experience before. His engine is one of the few rejoicing in pinned piston rings, and these were in beautiful order, tight, and bright over the whole of their circumference. One reason for a slight loss of power was a thick deposit of dirt on the gauze interposed between jet and valve box; this is a very common experience, and personally I knock out any such gauzes in my machines. He concludes by saying that, though his machine is a standard single cylinder of the best make, he has enjoyed far better running, since he increased his air supply by drilling six $\frac{1}{16}$ in. holes in the carburetter adapter. I do not know a single standard twin-cylinder which, as turned out by its makers, can supply the engine with all the air it needs when fully accelerated, and I have often found my single cylinders were equally starved of air when running fast.

Start of the Three Miles Race of the Essex Beagles A. and C.C. meeting on the Canning Town Track last week. This was the only event for motor cyclists on the programme, which accounts for the small field of three.

London = Land's End = London.

By A COMPETITOR.

AS I have never ridden in an End-to-end competition or the *double* journey from London to Edinburgh, perhaps I am hardly qualified to draw comparisons with the Motor Cycling Club's London to Land's End and back competition; but on the face of the rules and conditions governing the three long runs it seems quite obvious that the run to Land's End and back is by far the most strenuous. I have ridden from London to Edinburgh twice, and this 400 miles run is quite a picnic compared with the single journey to Land's End. Before returning from Edinburgh a competitor for the special cup and Schulte had a full night's rest and a full day afterwards to recuperate, but at Penzance (ten miles back from Land's End) only seven hours are allowed for feeding, sleep, and attention to one's machine before starting on the return journey. A competitor arriving at

Most of the competitors turned up at Cranford Bridge on Sunday some time, and it was generally thought that the Jarrott Cup would be won by either Summers or Frost. I left only two minutes later than Summers, and we saw a great deal of each other, riding miles together (except in the secret controls), and I know that he must have made a splendid performance. Frost being behind me, I saw little of him, but when I did he was jogging along in his own particularly happy and regular style. Both he and Summers must have found previous experience in running to schedule time very useful.

Riding to a Schedule.

As far as I can judge, I was not more than five minutes, in the aggregate, out in the six secret controls, but I fully anticipate that others will have beaten me hollow. Unfortunately, I suffered with a watch that

Three successful competitors in the M.C.C. London-Land's End-London run on the 3rd and 4th instants.

H. R. Dougal (5 h.p. Vindec).

C. C. Cooke (3 1/2 h.p. Triumph).

A. J. Sproston (5 h.p. Rex).

Penzance dead on schedule time had 8h. 23m. before starting again; but even this is not much after a ride of 279 miles.

Other Competitors' Views.

It was generally conceded by End-to-end and Schulte Cup riders taking part in this run that it was the most severe they have ever ridden in, and after going through it I can well believe them. Had the weather been bad—well, this had better be left to the imagination; but I could not help worrying about it before starting, because I had such a gruelling when I went over the course *en route* for the start of the recent End-to-end run. I had pouring rain all the way from Staines to Chard the first day, and the same thing from Okehampton to Redruth the second day, and again after leaving the riders at Taunton on the Tuesday morning had rain from Salisbury all the way home to London. Had the weather conditions been the same on this run only twin-cylinder machines from 4 h.p. upwards could have kept to schedule, for the headwind accompanying the rain whilst crossing the moors from Launceston to Bodmin made it absolutely impossible for me to average more than about seventeen miles per hour over this section.

lost time, which was very annoying, and a combined speed indicator and mileage recorder I was to have used did not turn up. The most difficult matter was on sections of the route where the milestones were hidden or missing, and in other places where a signpost gave one mileage to or from a certain place and a milestone close by a different mileage, and again in places the mileage according to the milestones did not tally with the distances on the route card. However, I made a practice of jogging along at twenty miles an hour as near as I could judge, directly I entered a thirty miles stretch of road where the secret check was situated.

As I was number seven on the list of starters there were only six riders in front of me, whom I could pass if they had to stop for any reason. The first man I saw in trouble was Cooke, who had a puncture, unfortunately in the first thirty miles stretch of road where the secret check was. Soon after leaving Andover I caught up with Summers, and we rode into Salisbury together, where we filled up with petrol. We found the official Crossley car there, the passengers, including F. T. Bidlake (timekeeper) and W. H. Wells, partaking of a second breakfast. Several riders came in while we were there, and we left them busy obtaining petrol.

London—Land's End—London.—

We had now about sixty miles to cover before reaching Chard, the starting point of the second thirty miles stretch, with a secret check in it. Gwynne, Summers, and myself split up soon after leaving Salisbury, and the next time I saw Summers was just as I was picking myself up from a heap of stones on the grass at the side of the road. How I got there I hardly know, but anticipate that I caught a large stone with my front wheel as I was looking back, or I may have fallen asleep. Continuing about two miles, we found official Dickson with his Rover car taking times for the purpose of discovering whether any riders were more than fifteen minutes ahead of their schedule time. I believe one was caught. Arriving at Yeovil, I pulled up at the Mermaid Hotel. Another 17¼ miles and I was on top of the secret check section, and incidentally getting near lunch, for which I was quite ready. The road from Chard to Exeter abounds in severe hills, and one had to open the throttle well to keep up the requisite average of twenty miles per hour. As I knew the road, I was prepared, and got along very nicely; but I saw a man stick on a ticklish hill a few miles out. The checking spot this time was a few miles from Exeter, and I believe I was very close on time—possibly closer than at any other. Exeter was reached in due course, and one of the Baddeleys signed in just after me.

The Lunch Interval at Exeter.

While having lunch the different riders kept coming in, and an animated conversation was soon in full swing. So far my machine had run perfectly, and I only had to fill up with petrol, so that I had practically an hour and ten minutes in which to feed and ride to the other end of the city to be checked out. Sproston had had several punctures—in fact, the puncture fiend must have paid him special attention, for I saw him at least half a dozen times during the run repairing tyres, but he was always quite merry. Summers once found him asleep on the roadside outside a control, and had to shout to wake him up.

When I arrived at the out check at Exeter a few minutes before I was due to start, Gwynne was just leaving, and Summers ready to leave in six minutes. Cooke turned up in time to start on schedule, two minutes ahead of Summers. Twenty odd miles now lay between us and Indian Queens, where the next thirty miles with secret check started, and I have to thank providence that so great a distance intervened; otherwise I should never have arrived at the actual checking point anywhere near schedule time. Four miles from Okehampton I had tyre troubles, the inner tube splitting about five inches. I have an idea that the nature of the road had something to do with it. As I had no butted tube, I had to take out the back wheel to fit another endless tube.

Making Up Lost Time.

I was some eight minutes ahead of my time when the trouble came, and this eight minutes proved a boon, because when I reached the check near Zelah, about sixty-four miles from where I had my tyre troubles, I had only just caught up to schedule time, and that eight minutes "saved my bacon," as the saying goes. About a mile from Redruth a competitor passed me behind time, and as I had not passed him on the road I guessed he had lost his way somewhere. I heard at Penzance that only seven riders passed the check at

Zelah, all the others taking the wrong road through Truro. I almost went wrong myself, but stopped and consulted my map. I ran across Summers again at Hayle, 7¼ miles from Penzance, having refreshments, so I joined him. We then rode into Penzance together, he going on ahead soon after. Land's End was reached in due time, and the shocking surface of the road was very unpleasant after such a long journey. A thick sea fog prevailed at the End, and when I reached the fork road about one hundred yards from the Land's End Hotel I could not see the building. Adam was there, with Summers and *The Motor Cycle* photographer. I was glad to leave again for Penzance. The timekeeper had arrived to time us at the Union Hotel. A good dinner was provided, for which everybody was ready. No stop was allowed for tea as on the London-Edinburgh run.

The Homeward Run.

The bed pulled very much when I was called at 2.30 on Tuesday morning, but I struggled up and went round to Taylor's garage, where the machines were stored. It was quite dark at that time (three o'clock), and we were wondering if it would be necessary for the earlier starters to light up. The difference in the light at 4 a.m. at Penzance and Cranford Bridge was particularly noticeable, but it was just light by the time Bidlake gave the word "go" to Gwynne. My engine started away immediately, and I soon picked up with Summers and Cooke. After a few miles we ran into what I suppose was a thick land fog, which was very unpleasant, as it settled on our clothes. The worst part of it was that though we were wet the dust was thick and dry on the roads, and as it rose from our wheels it settled all over us. I could feel it settle on my eyebrows and eyelashes, and one could not wear goggles, as they became covered in moisture in a few minutes. This lasted nearly all the way to Launceston, when the sun began to break through it, and by the time we reached Okehampton the weather was glorious. The sun dried our clothes, and the wet and dust which had clung to our clothes dried up, and we looked as if we had been having a dust bath. The first secret check on the return journey started at Redruth, and extended over the section of the route that so many had missed. It was a ticklish road to find, and not one of us was any too sure of finding it, and between five and six o'clock in the morning, and an unfrequented road at that, there was little chance of asking anybody the way. As it happened, the check was at the turning, about a mile and a half outside Redruth, which was fortunate for those who went the wrong way on the outward journey, and consequently did not know it. At the same time, being so close to Redruth, it nearly caught more than one napping.

A Difficult Road to follow.

About a third of the way through the section Summers and I found Sproston enjoying a cigarette by the roadside just by some cross roads, and he said the others (meaning, I presume, Gwynne, Cooke, and Adams) had gone straight on, but we were not satisfied. So out came a map, and after consulting it we decided the others were wrong. Gwynne passed me later just outside Bodmin (the end of the thirty miles section), so evidently he had been roundabout. When he passed me I was in doubt as to whether I was on the right road, and I decided to stop and run back into Bodmin to make sure. On the way back I found Sproston and

London—Land's End—London.—

Cooke discussing the way, and just after Gwynne came back in doubt. After settling the point satisfactorily we retraced our steps, and Cooke and I were in sight of each other practically all the way to Launceston, and when we arrived there Gwynne and Summers were making in petrol, so Cooke and I followed suit. I next saw Summers just outside Okehampton, and, being a little ahead of time, I cleaned the sliding pistons in my Triumph carburetter, as the throttle piston had not been responding to the thumb lever.

I pulled up in Okehampton, and I found my back tyre very soft, but, finding no nail or anything in the cover, I pumped it up. Just as I was leaving, the official car turned up. As Exeter is only $22\frac{1}{4}$ miles away, and since the second secret check started immediately on leaving, after an hour and a quarter top, it was essential that I should not be late. To make up the time spent in repairing a puncture in a run of $22\frac{1}{2}$ miles would not have been an easy matter on such a road abounding in hills and very rough into the bargain. As luck would have it, the tyre lasted into Exeter, but it was almost flat when I got there. About four miles from Exeter my engine lost its regular pulling powers, and I found that, no matter where I placed the throttle lever, the engine would not run if the air lever was opened more than about a quarter of its travel. Being so near Exeter and with a few minutes in hand, I kept going, but stuck on the long, steep hill just before reaching the city. The Mabon clutch proved its utility here, for by starting up the engine by running down the hill a few yards and then bringing the free engine into use I could turn the machine round, and by engaging the clutch a little the machine pulled itself up the hill with me walking alongside. I signed in at Exeter about one minute early.

Carburetter Gauze Choked.

The next thing to do was to attend to my tyre and engine. The leak in the inner tube I found to be caused through a defective patch, and I soon had this right. I could find nothing wrong with the engine, so I had the carburetter to pieces, and apparently everything was all right.

When I started from the check at the end of the city I found no improvement in the running of the machine, and was bemoaning my fate when I thought of the gauze over the jet being probably choked with dust. Having four minutes to spare before leaving, I took out the piston, and immediately I saw the gauze I knew had located the trouble. I left Exeter rejoicing and the engine pulling better than ever.

The Fifth Secret Check.

All through the fifth thirty miles section from Exeter I only saw one rider. The secret check was towards the end of the section, which called for over twenty miles of strictly legal limit pace, which is quite a tax on one's nerves. This over, I made my next stop at Yeovil, pulling up at the Mermaid Hotel again for a long drink. I ran across Summers again leaving Yeovil, and we kept together until we reached Lovelace's garage between Sherbourne and Shaftesbury, where we found some of the competitors filling up with petrol, so we did the same. J. O. Dixon came along before I left and also pulled up. The brothers Bentley passed by. At the right angle bend near Shaftesbury I saw Cooke in trouble, and it appears that, owing to a machine being

in the way, he ran into the bank when turning the awkward corner and damaged his front wheel. About a mile from Salisbury, Dickson with his car was taking times, and I was pleased to see Chas. Jarrott there also, he having driven down on a Sizaire-Naudin car. After a stop for petrol in Salisbury, we continued our journey, but roamed round some back alleys before getting out of the city. Another $17\frac{3}{4}$ miles and Andover was reached, the starting point of the final secret check section. Here again the check was near the end, F. J. Jenkins, with his Rover car, taking the times. Near Staines I found Summers and Gwynne together,

Two Triumph riders in the End-to-end Run. J. Marshall (on the left) tied with W. H. Wells and R. Moore for best performance by a trade rider. The other rider in the photograph, C. E. Murphy, was one of the twenty private owners to lose no marks.

the latter doing something to his belt. I jogged along, and when I saw Dr. Gibbons at the turning leading from the Staines Road, I was not sorry that I was only a few miles from the finish. When I arrived at the Berkeley Arms—kept, by the way, by E. Parlby, the ex-champion professional cyclist—I found a goodly crowd assembled to welcome us in, including the donor of the chief award—the Jarrott Cup. I anticipate that in spite of the severity of the run a larger entry list will be forthcoming if the event is continued annually. I think that the start back might be at six o'clock instead of four or even five o'clock, giving time for sleep at Penzance and yet finishing in daylight. I used $4\frac{1}{2}$ to 1 gear on my Triumph right through, and a new Shamrock belt, which did not need shortening once.

HARRY G. BELL.

W. and R. Jacobs, 39c, King William Street, E.C., have just issued a new illustrated leaflet of motor cycle accessories, most of which particularly appeal to motor cyclists. These accessories are sold under the name of "Electary" requisites, and comprise lamps (both gas and electric), accumulators, belting, mirrors, and many other useful articles. Needless to say, the leaflet can be obtained immediately on application to the firm at the above address.

OCCASIONAL COMMENTS

By "IXION"

Tacky Solution.

A friend writes that he concurs in my remarks about "tacky" solution. He agrees with me that "tackiness" means a far drier condition of the solution than the word can in theory convey. He derides the instructions given with repair outfits. He has two outfits, in which the printed slip of instructions says, "Coat patch and inner tube with solution, and apply patch to tube *immediately*" (the italics are mine). Yet as every practised rider knows, if these directions were followed the patch would not adhere for more than a few moments. I have been similarly deceived. I read the directions, imagined I had struck a new sort of solution, applied the patch immediately, and then had to clean the tube and patch with petrol and begin all over again.

An Interesting Panne.

The other week a friend and myself were in a difficulty with a big tricar. It had been running in form good enough to win an open hill-climb, when within half a dozen miles it became very uncertain in starting and dropped a large percentage of its power. All the ordinary details were in magnificent order, and at last it was remembered that a new ten gallon drum of oil had been opened to fill the tank the very morning the trouble manifested itself. The drum had been procured direct from the oil company, and was properly sealed and labelled, but its contents were very far from being water-cooled engine oil. Consequently the tank was drained, the engine cleaned, fresh oil procured, and a resolution made never again to patronise an oil company who did not know what was in sealed and labelled drums leaving their factory. But the sad upshot of the matter was that the good oil failed to entirely obviate the trouble. Our suspicions next turned to a faulty bearing, and we took the engine down.

Our Discoveries.

I suppose the veriest novice is aware that the crankshaft of a motor cycle engine revolves within two hollow cylinders, usually made of phosphor bronze, and vulgarly known as "brasses." They are fixed in the aluminium of the crankcase, and are oiled by splash from the flywheels. A tiny V groove runs across the inner face of each brass, from end to end, and a certain amount of oil gains admittance on some engines at each end of the V groove. But the main portion of the oil reaches the "brass" at a hole drilled into the V groove from the outside of the brass, which hole is in register with one or more oil channels drilled through to it from the interior of the crank case. It will thus be obvious that if one of these brasses turns round in its aluminium bed by so little as one-eighth part of an inch, the oilhole in the brass will be out of register with the oil channels in the aluminium, and that bearing will run dry, fire, and seize up. It is to prevent these tiny oilways from getting choked that motor cyclists

are advised to rinse out their crank cases with paraffin every 1,000 miles, and this precaution had been regularly observed with the engine under notice, and so all the oilways were clear. Yet at one end of the crankshaft the steel of the shaft was "fired," showing blue, red, and green—all manner of iridescent colourings—while the brass itself was scraped, lined, and burnt. The reason was that by incredible slovenliness of manufacture these brasses were merely tapped a close driving fit into their aluminium beds, with no peg or other precaution to prevent their turning round. Consequently one brass had slipped round $\frac{1}{8}$ in., cut off its supplies of oil, and run dry, so that if the engine had been allowed to run for another ten minutes, a bill of several pounds for repairs would inevitably have occurred. All bearings ought to be securely pegged, or otherwise fastened down.

Another Discovery.

Incidentally, we found cause to abuse the maker's workmanship in another respect. With this and the other exception already named, the engine was in such splendid order that any mechanic who dismantled it would say, "Here is an owner who understands the petrol engine, and is an adept in maintaining it."

Demarcation. On which side of the dividing line between the motor cycle and the car is the little O.T.A.V., which competed at Brooklands on the 1st Inst. ? It has motor cycle wheels, V belt transmission, and air-cooled engine.

Well, we found the crankshaft pinion of the distribution gear had $\frac{1}{8}$ in. play on its key—a defect of accuracy which, of course, was greatly magnified in passage through other moving parts. This vital cog wheel was only secured by two miserably inadequate steel pins, bedding into its periphery, where leverage is greatest, instead of by a sturdy key passing through its centre. That engine is now reassembled with some stringent modifications of workmanship, and I can only add that when makers continually receive back engines to find the same defects for ever present, and do no trouble to remedy them, such foolish policy eventually costs them dear.

Thirteen Stone versus Two Horse-power.

By B. H. DAVIES.

WHEN Mr. Feeny, of the Moto-Rêve Co., suggested that I should test one of his little 2 h.p. motor bicycles ("toys" I used to call them), I admired his sanguine trust in his machine, felt extremely doubtful whether I should be able to do anything about it that would be fit for print. However, last month I found myself temporarily machineless on an extraordinarily hilly part of County Durham, and that two or three local enthusiasts were casting envious eyes on lightweights in general and the Moto-Rêve in particular, and had been further fortified by witnessing some game hill-climbing by G. L. Fletcher on a similar machine in the End-to-end. Consequently I wrote Mr. Feeny that if he was game to risk the reputation of his machine in so stiff a county as Durham, I was game to try and break its poor little back. He responded by sending a machine; and what a joy the condition of the machine was to a poor tester of my makes, usually dispatched to him devoid of all necessary equipment. The little Moto-Rêve was fitted complete with lamp, stand, plates, toolbag, and spares; and its appearance so captivated a friend of mine when he saw it at the railway station that he immediately stole it from the parcels office and pedalled it two miles, including a most wicked hill half a mile long, so that he might lose no time in seeing it perform on it.

The Machine's Hill-climbing Capabilities.

I had not gone a mile on it before I realised the great comfort on a level road. It was a little noisy on rough surfaces and potholy byways, as I would expect from the mere fact of its lightness, but a very pearl of comfort on anything approaching a decent highway. The irony of fate compelled me to ascend one of five awful hills before I could give it a climbing test at all. In justice to Mr. Feeny I use the worst of the five, a hill locally known as Langley Bank. It is seven-eighths of a mile in length, and is reputed to average 1 in 10. It starts straight away out of a colliery village, so that you cannot get a push at it, and halfway up, just when the engine is feeling the strain, there comes a very bad corner on a gradient which is certainly no better than 1 in 6, and may be a good deal worse. It is difficult to estimate gradients accurately when the countryside rises with the road; but judging from the performance of other machines—and I have ridden this bank a hundred times more—it is, at any rate, 1 in 6. The machine came up excellently as far as the bend, where there was a great need of pedal assistance. A 36in. leg and a 21in. frame comprise what might be called an ill-matched couple, but I gave it what assistance I could, and it proved sufficient. We went up, and I was by no means puffed over it either. I made five or six ascents of the hill, and, except for one attempt in very greasy weather, I was always successful, provided the belt was tight. The belt as sent out to me was much too loose, and until I got a piece of leather to insert it had a habit of pulling through on hills. Being a Stanley machine it gripped admirably when quite slack, and on slackening it I managed the hills nicely. After I tried it up some hills of more ordinary calibre, I found it would ascend the average 1 in 15 sort of

slope in flying fashion and well up to legal limit, even with a load of thirteen stone. There were worse hills around—regular terrors, which I knew from the "feel" of it on Langley Bank it would not climb, and so did not trouble to go and try. I believe, however, that with what I know of it now, I could have got it up decidedly tougher ascents, as the sequel will show. Testing it on the flat the highest speed worked out at a shade under thirty-five miles an hour.

All this time I was not satisfied that I was getting the best out of it. The little engine gummed up very badly when standing, and ran very hot after a few miles; but none the less it ran nicely enough to make me risk the long run from Durham to Northampton at the termination of my holidays—a distance of 213 miles. I started from a point six miles out of

The above illustration depicts Mr. G. W. Raper, of Newcastle-on-Tyne, with his 6 h.p. twin-cylinder N.S.U., which is fitted with Continental non-skid motor cycle tyres. We are informed by the Continental Tyre Co. that the tyres in question have run 1,200 miles without showing any signs of wear. Mr. Raper has won gold medals with this machine in the Sutton Bank Hill-climb and the London to Edinburgh Run. Mr. Smith, of the Percy Cycle Co., is leaning against the handle-bar, and Mr. Bing, the northern representative of the Continental Tyre Co., is examining the cover.

Durham at 8.30 a.m., and the machine ran very badly indeed. The engine overheated so grossly that the mildest rise called for pedal assistance, and sometimes it petered out on the level, and I had to wait and let it cool a bit. I could find nothing whatever the matter anywhere, and I never suspected the oil, as it had been in the tank when the machine came from the makers, and I naturally supposed they would fill it up with the most suitable lubricant they knew. I gave it "lashings" of oil after the first mile or two, but was disappointed that it would not run ten miles on a pumpful, as I rashly supposed such a tiny engine should do, forgetful of its high speed. Howbeit, in spite of these failings, the twenty-five miles into Darlington occupied no more than two hours. I climbed the little steep pitch at Croxdale nicely, but failed near the top of Ferry Hill. I was disappointed that I could not find out what was wrong, but as I had no prospect of testing it further after reaching Northampton, I resolved to push on somehow as far as Doncaster, and thence train home. I also registered a mental vow that I would make it press twenty miles into an hour somehow somewhere. Things

Thirteen Stone versus Two Horse-power.—

went from bad to worse as the nine miles from Darlington to Scotch Corner took up a whole hour, owing to rests while the engine cooled, and I was now a good deal west of the railway, and far from any station at which a fast train could be caught. So I pushed on miserably enough as far as Boroughbridge, and here comes a lesson on the blessings of perseverance, which the dejected owner of each or any make may well take to heart. At Boroughbridge my oil supply was exhausted; and if I had done badly on the oil put in by the makers, I expected to do worse on any chance purchase in a small Yorkshire town. Vacuum A pleased me most of the two or three brands on offer—*en passant*, I visited four shops before I met a salesman who would break into a gallon can for me, and my little tank only held a pint all told. There is, I say, a special blessing on perseverance, even when it is of the dogged, unthinking, bullocky order, and, behold! no sooner had the first charge of Vacuum A drifted into that little engine than it began to leap away like a fiend possessed, and thence to Northampton, 153 miles away, my running time was only six hours, and every hill was taken on the fly.

An Immense Improvement in the Running.

I had no single involuntary stop the whole of the distance, and the pleasant experience of speed, power, comfort, and reliability has left me with a most delightful impression of the high qualities of the Moto-Rêve. When I say "no involuntary stop," I ought to say no stops caused by the machine, for I had several very protracted stops indeed, due to the discourteous and unbusinesslike habits of garage people. Neither oil nor petrol tanks hold a can apiece, and some garage people were unwilling to break cans; while at Stamford one of them refused to supply me at all, though the place was open, and it was only 7.30 p.m. At a far less pretentious place at the top of the town I was quickly and politely served by a housemaid in cap and apron, who knew all about funnels and prices and the difference between air and water-cooled engine oil. She was quite distressed because I insisted on having Vacuum A instead of air-cooled oil. I shall avoid these pretentious gentry in future; their discourtesy cost me forty-five minutes. Again at Wetherby I went to four "hotels"—heaven pardon the false description—before I could get any lunch. I was twenty minutes behind the regular hour, and the hungry Yorkshiremen had apparently gnawed the last succulent morsel off their knucklebone of ham. So altogether I was very late in getting South; and, not fancying night riding with the oil Holophote supplied by the Moto-Rêve Co., I called at Whipple's in Grantham to look for an acetylene lamp. He is a veritable prince of accessory dealers, even as Corcutt, of Doncaster, is the prince of repairers. When you go to Whipple's, you may rely on finding no mouldy assortment of out-of-date accessories, but a complete range of all the newest and cutest little fakements; and I generally leave his shop about a sovereign the poorer, but with my kit correspondingly enriched. This time I got out for 17s. 6d., including a very serviceable little gas lamp, which lit me safely through two or three tiny but excessively dangerous little Northamptonshire villages, with their narrow, tortuous streets.

So the duel between my 13 stones and the 2 h.p. of the little Moto-Rêve ended in my weight being

summarily vanquished. The machine proved it could take me up any main road hill, with some pedestrian assistance on stiff single figure gradients, and that could, if need be, average in excess of legal limit; in fact, the twenty-one miles from Grantham to Stamford in the twilight occupied forty minutes dead.

As regards economy, I do not know what instructions of the makers may be about their own, but I used a charge of Vacuum whenever the engine seemed to call for it, which was on an average about once in five miles. I used a pint and a half in all. petrol, I used two gallons and a half, which works out at about eighty-five miles to the gallon.

The Specification.

Coming to a detailed description of the machine which is as yet unknown by sight to many of us, the engine is a V twin with automatic inlet valves. The whole of it is fairly accessible. The ignition is by a very neat little Gianoli magneto, which worked admirably at all engine speeds. The ignition advance is automatic, the synchronisation of the firing being perfect. The carburetter has two microscopic jets, which is clearly efficient, and gave no trouble. Control is simply by throttle, a Bowden wire and handle-bar lever being employed. The extra air is worked by a piston slide on the float chamber. I think a more convenient means ought to be devised for operating this, as I was always altering it to suit varying speeds, and it is too small to work with a gloved hand. Incidentally, I got a few healthy shocks from the magneto in altering the air. The carburetter is devised to feed cold air to the cylinders if the throttle be shut, and the compression used as a brake downhill. I often used this, as neither of the brakes sufficed to stop the machine, in the adjustment with which they were sent out. I adjusted them once or twice, but without effect; they seemed to have small stopping power even when pressing hard on the rim.

The weak point of the machine—I say "the machine," advisedly, for I found no other—lies in the wheels and tyres. These are far too light for a machine that is intended to be used on average English roads. I found that riding over quite a small piece of road metal at a strictly moderate speed was enough to indent the tyre with the $1\frac{3}{4}$ in. tyre inflated board hard, and any man who uses the modern lightweight on general roads will have to choose between riding on slack tyres or specifying heavier rims and tyres, which latter is of course I personally shall adopt. I had to knock several kinks in the rim before leaving Durham. Given a heavier pair of wheels and tyres, I think the Moto-Rêve may claim to rank as the best lightweight machine for hard service that has been brought out, while it will beat many more powerful machines for comfort—this must be experienced to be realised, and, naturally, is far more handy when one is out of the saddle, and lugging it about. As the result of tests of it, I do not hesitate to say the efficient lightweight has indeed arrived at last, and in future I should not shrink from any journey on such a fascinating little tabloid essence of reliability.

[Notes: Distance, 213 miles; cost, petrol 2s. 11d. oil 10d.; stoppages, two to shorten belt, several due to bad oil in early stages; total nett running time, 16 hours. My wife made the same journey by train; cost her a guinea, and the time occupied was ten hours from house to house.]

Questions & Replies.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied with a stamped addressed envelope for reply.

A Clutch for a Light Tricar.
Please advise me which of the two following clutches I have are suitable for a light tricar, weight about 2½ cwts., fitted with a 5-6 h.p. Peugeot twin engine? (1.) Light steel cone clutch, 5in. bore smallest diameter taper to 5in., inch wide on face, male part copper-faced. (2.) Heavy cast-iron cone clutch, 7½in. smallest diameter, 1in. wide on face, leather to iron? I should prefer the smallest, but am afraid it is not large enough and would slip a lot.—A.C., Sydenham.

Of the two clutches mentioned in your letter we should recommend No. 2. A leather to metal clutch is quite satisfactory if properly designed.

Regarding Tyres.
(1.) Would Palmer tyres, if fitted with Elastex, be absolutely puncture-proof? (2.) Would Palmers if fitted with Bates's non-skid bands be free from side-slip? (3.) Can you tell me of any maker of a roll-up tool kit for spares and tools required for a motor cycle?—GROSVENOR, Cheshire.
(1.) You will not be troubled by punctures if you use Elastex. (2.) Undoubtedly the risk of sideslip would be reduced, but it would only be advisable to fit the non-skid treads referred to after the corrugations of the Palmer tyre were entirely worn down, as the latter act splendidly in preventing side-slip. (3.) Such a tool kit may be obtained from practically any first-class dealer in accessories.

Machine does not Answer to Throttle.
I am riding a 1906 twin Rex with automatic inlet valves. This will not answer to the throttle. It is fitted with Longuemare carburetter inlet valves about 3-16in. lift. Heads and stems of same seem quite true and clean. Could you tell me how to remedy same? I may say all the extra air and four holes of the fixed air have to be closed for running. Machine runs about fifty miles to the gallon whether a No. 5 or 7 nipple is used, and yet it takes no air.—A.S., Hull.
Take down the carburetter and clean carefully every passage in it. If there is no improvement you will require a larger jet, and you will find that the machine will take all the extra air, and

answer to the throttle properly if the level of the petrol is correct, viz., ¼in. below the top of the jet orifice. You should be able to run seventy-five miles to the gallon easily.

Petrol dripping from Carburetter.
(1.) Please give me instructions re grinding needle valve, as petrol drips from carburetter when tap is left on? (2.) Is red lead or similar substance used when refitting unions to petrol pipes? I had mine off, and now there is a continual leak of petrol, with the result that the carburetter does not get its proper supply. Is this the cause of erratic running and starting? Also was this the cause of the petrol catching fire recently?—S.F.
(1.) See notes on valve grinding in "Motor Cycles and How to Manage Them." A fine grinding material is

John Haslam, of Sheffield, who rode a 3½ h.p. Rex in the End-to-end Trial, and gained full marks.

necessary, such as crocus powder, and the needle can be held in a small drill chuck. (2.) If the petrol leaks through the union it probably means that the latter is not sufficiently tight, or else a piece of grit or something is preventing a good joint being made. Often a refractory union can be cured by wrapping the joint with thread, and also by smearing a little soap round the edges. This is quite likely to have caused the erratic running, and to have caused the machine to catch fire, especially if the petrol drips on the exhaust pipe or silencer.

Accumulators Running Down Quickly.
Please advise me as to the cause of my accumulators running down quickly. I use a well-known plain coil, and have accumulators slowly and thoroughly charged, yet cannot travel on an average more than eighty or ninety miles before the accumulator is down below three volts and without any warning. Am careful to take out connecting plug when dismantling and never leave it on contact. My large accumulator should run me at least 300 miles.—W.F.W., Stafford.
We should, first of all, recommend you to try another coil, and then if the accumulator behaves in the same manner send it away to the makers and have it repaired. It seems very much as if it were suffering from an internal short circuit. The consumption of the coil should also be tested.

Various Querles from a Novice.
My engine gets very hot after a short run and stops. It is a 3½ h.p. with B. and B. carburetter and accumulator ignition. It will not answer to spark advance lever. The spark occurs when piston is at top of compression stroke. Is this right? What is the cause of the exhaust valve stem being sooty? Has that anything to do with getting too hot? Exhaust valve spring just springs back when lever is released. Do you think that a stronger spring would act better? The inlet valve will just open when given a sharp shake with hand. Is this spring strong enough? The jet is about the size of a hairpin. Is this too big? What is the best material to use to act as washers to make petrol-tight joints?—J.A.W.
The trouble seems to be due to the carburetter, the jet being too large. This causes too strong a mixture to be drawn in, which causes the sooting of the exhaust valve and overheating. The fact that advance of the spark will not make any difference is owing to the engine not getting sufficient air at high speeds. The ignition seems to be right. The exhaust valve spring appears to be rather weak, and a stronger spring would be advisable. The inlet valve spring would be about right. A properly ground joint should be all that is necessary, but a leather or fibre washer would do quite well, and last a long time if properly fitted.

The Personal Factor in Driving.

NO doubt when "Ixion" wrote the article "Can Motor Bicycles Climb Hills?" in the issue of July 22nd he had in mind the murmurs of the many amateur riders who are dissatisfied with the performance of their machines as compared with ostensibly similar machines in the hands of paid riders.

Putting aside the question of whether or not the trade man's machine is in all cases a duplicate of the standard sold to the public, there is no doubt about "Ixion's" correctness when he attributes the failure of the amateur to lack of pluck and skill. Pluck is in this case simply the familiarity born of custom, because the regular competitor in trials of all sorts becomes better acquainted with the extreme limit of safety under various conditions than the ordinary pleasure rider can hope to be. The matter of skill raises a more serious issue. Writing with his usual evident knowledge of his subject "Ixion" declares, in effect, that the motor cycle is a machine from which it is so extremely difficult to obtain the best results that only a small number of men out of the large body who spend most of their time in the saddle are able to master it. The statement is as regrettable as it is certainly correct, for, however much one may admire the dare devil and the mechanical genius, the average rider of a motor cycle is neither the one nor the other, and after all it is for the average rider that the maker has to cater. A maker is not justified in selling to the public a machine requiring nerve or skill for its safe and efficient handling; he must combine his own scientific knowledge with the mechanical insight of his paid rider, and evolve a mount controllable without any special qualifications whatever.

Skill in Tuning-up and Driving.

Skill as at present required for the handling of the ordinary motor cycle may be divided under two heads: Skill in the preliminary tuning up and skill in driving. The aim of the first will, as "Ixion" says, be different according to the trial to be gone through; whether climb, race or economy test, but generally it may be taken that tight valves and fine clearances, close contacts and piston rings making something like a fit in the cylinder constitute the minimum requirements for good work. Carburation will require different treatment according as low petrol consumption or speed is the more valuable, and this about covers the ground as far as engine tuning goes. Then comes driving skill, a deficiency of which may hopelessly mar the pains taken in tuning up. Once in motion, whatever the form of contest in view, the very best results can only be obtained by ceaseless vigilance and unflinching

cleverness in manipulation. The reacting and to some extent interchangeable conditions of throttle opening, ignition timing, and carburation must receive attention with every alteration of engine speed, which means that with an engine making perhaps a couple of thousand revolutions a minute there is not a wide margin for miscalculations; a rider must have an almost supernatural hand and eye to make the necessary delicate movements of his levers to suit conditions as they vary. It is not to be wondered at that a few only ever reach a high standard of perfection.

It is impossible to over-rate the value of exactness in the adjustment of the various elements of control, and this is especially the case with ignition timing. The effect of spark advance is, of course, virtually to increase compression by using the combustion of a portion of the charge to further compress the remainder before the piston commences its power stroke. Clearly, then, high engine speed demands high compression, and consequently an early spark, but there is another deciding factor to be taken into account. An engine running at high speed with partly closed throttle and light charges entering the cylinder will demand an earlier point of ignition than if it were taking full charges, because in the former case what may be called "natural compression," due to piston displacement, will be less than in the latter.

The One Lever Controlled Machine.

The production of a motor cycle with its engine controlled by a single lever of the "the-further-you-push-it-the-faster-it-goes" order seems to be a very long way off at present. Yet there can be no doubt of its ultimate arrival. The incessant tiny variations of mixture, spark, and throttle would be much better in the care of some unerring mechanical device, for, whatever may be said of the pleasures of "tap twiddling," the general run of rider buys his machine to ride, and not to experiment with, besides which the provision of automatic means of control would lead to better results and kinder treatment generally than can be expected from the discretion of Tom, Dick, and Harry.

It is a truism that an article for use by average people should not require more than average ability to use it; therefore the sooner makers produce machines whose handling can be properly managed without special skill or knowledge, and mount their own men on them, the sooner will the charge of "special machine" cease to be hurled at the paid rider.

J. B.

We recently had a few miles run on a $3\frac{1}{2}$ h.p. Brown motor bicycle fitted with a Cowey speedometer. (It is the speedometer to which we refer in this paragraph; the running of the Brown machine will be recorded in due course, as we are giving one of these machines a good testing.) It was most interesting to note how the indicator needle crept up one-eighth of an inch at a time as the throttle was opened. Every motor cyclist knows how difficult it is to estimate speed in towns after a fast run on an open country road, and this is one great boon in a speedometer; but perhaps its greatest advantage is in being able to note the speed a machine will climb a steep hill just after cleaning the piston head and cylinder and grinding in the valves.

and again after running for 1,000 miles without making any adjustments to the machine. Similarly, different brands of oil and petrol can be tested, and the ratio of gear which gives the best results more easily found.

Users of Longuemare carburettors will be interested to hear that the models E. and H. are now provided with a lever for actuating the air mixing collar, which has a vertical motion instead of a sideways motion with which these models were previously fitted. A vertical motion means much greater simplicity in the operating rods. Mr. E. J. Hardy, Bishop Street, Coventry, is the wholesale agent for Longuemare carburettors on this side of the Channel.

A Record Ride.

An American motor cyclist last month rode from New York to Chicago (1,112 miles) in 49h. 40m., creating a new record. His speed is equal to an average of $22\frac{1}{2}$ miles per hour throughout.

A Heavy Fine.

For exceeding the limit on the Bromley Road, an unfortunate motorist—Colin Defries—was fined £50 and costs, and had his license suspended for twelve months. Several other previous convictions were brought up.

Police Traps.

At Adhurst Hill, about one mile on the London side of Petersfield. On the down grade, worked by signal from the police station, a red cottage-like building.

Another near Trenham Bar Station, between Yarm-on-Tees and Thirsk.

On Great Watling Street, at Manfield Lane End, near Darlington.

Trials on Sutton Bank.

On Bank Holiday Monday, we hear, there were quite a number of motor vehicles of all descriptions at Sutton Bank. Godfrey Bosville, an owner of a $3\frac{1}{2}$ h.p. Triumph, writes that although several cars were unable to climb the hill without the water boiling and most of them stopping, he made a clean ascent of the Bank on his motor bicycle with a gear of $5\frac{1}{2}$ to 1, and without retarding the ignition or pedalling. His weight is $12\frac{1}{2}$ stones.

A.C.U. Annual Race Meeting.

At the annual race meeting of the A.C.U. at the Stadium, Shepherd's Bush, on Saturday, August 22nd, the following events will be included:

Mile time trials for the *Automotor Journal* Challenge Cup. Holder, C. R. Collier. Time, 1m. 2s.

One hour scratch race for *The Motor Cycle* Challenge Cup. Holder, H. V. Colver. 51 miles 146 yards.

Five miles handicap for the *Motor Car Journal* Challenge Cup. Holder, C. E. Bennett.

The above events are for machines fitted with engines not exceeding 76 by 76 mm. or the equivalent volume swept out. Cash prizes to the value of £5, £2, and £1, will be awarded in each event.

A five miles handicap for standard touring machines, fitted with motor cycle tyres (not less than 2in.), steel mudguards, toolbag with contents weighing not less than 5lbs., stand, and touring saddle. Cut-outs not allowed. Engines must not exceed 85 by 85 mm., or the equivalent volume swept out, and the gear not higher than 4 to 1, with 26in. wheels. For this event gold, silver, and bronze medals will be awarded.

A Successful Motor Cyclist.

Capt. Sir R. K. Arbuthnot, Bart., R.N., who won gold medals in the M.C.C. London to Edinburgh twenty-four hours' run and the A.C.U. End-to-end Six Days' Trials, has been an ardent motor cyclist for several years. He is at present in command of the Lord Nelson battleship, which is fitting out at Jarrow-on-Tyne.

Petrol Fumes as a Caterpillar Destroyer.

Herr Ludwig Heissmann, up to the end of 1907 landlord of the Dusseldorf restaurant Zur Mausefalle, but now residing in Cologne, writes to a German paper to say that caterpillars were cleared out of his garden by petrol engine exhaust. In 1905, he writes, a vine, two pear trees, and several dwarf shrubs fell victims to caterpillars; and at the beginning of the following spring the insects again made their appearance, notwithstanding all precautions against them. In June, however, he laid out part of his garden as a cycle track for his two boys, who played at pace-following, each taking his turn at driving or following a 2 h.p. Fafnir motor bicycle belonging to Herr Heissmann. The boys "trained" twice a day, and through over-oiling the engine the exhaust lay tolerably thick at times over the garden. Later in the summer his eldest boy came to him with the news that the caterpillars were gone, adding

ESSEX M.C. RACE MEETING AT THE STADIUM.

A.C.U. LONDON TO PLYMOUTH AND BACK RIDE.

that in his opinion they could not stand the fumes of the petrol. Herr Heissmann and the gardener verified the boy's statement about the absence of the caterpillars, and he remarks that he had never seen his garden with such a show of fruit and flowers as in 1907. We may say that the editor of the paper in question having received a letter respecting petrol exhaust as caterpillar-destroyer had asked for corroborative evidence on this point, request which drew forth Herr Heissmann's communication. We wonder whether any English readers are in a position to produce similar evidence.

Motor Union Defence Fund.

The expenditure this year in connection with the Motor Union legal and legislative defence fund exceeds the income. In consequence an appeal has been circulated among motorists throughout the kingdom for contributions towards the fund. The present excess of expenditure amounts to £48. Among the good work done by the Motor Union which should particularly appeal to motor cyclists were the work of examining Private Bills in order to prevent legislation contrary to the interests of motorists, successful opposition to two Light Railway Bills which contained provision for the construction of level-crossings on main roads, and other items.

Passing through a picturesque village on the edge of Dartmoor on the return from Land's End.

A.C.U. Defends a Motor Cyclist.
Through a printer's error the paragraph published last week under the above heading stated that the solicitor was instructed by the Motor Union to defend the motor cyclist, Mr. W. G. McMinnies, at Southam (Warwickshire). This should, of course, have read the Auto Cycle Union, as stated in the heading.

Series of Motor Car Lectures.
Motor cyclists are usually interested in anything appertaining to a motor vehicle, and an opportunity for readers to hear simple lectures on the complete mechanism of the modern motor car during the autumn is to be provided by *The Autocar*. This journal has arranged for Dr. Ormandy and Mr. J. H. Lester to give a series of eight weekly lectures illustrated by lantern slides and specimens of the actual working parts of cars, and to carry out simple, easily followed experiments where such experiments will aid the understanding of the problem under discussion. Five large centres have been selected, viz., London, Liverpool, Manchester, Birmingham, and Bristol, but the final selection of the centre at which the series of lectures shall be given rests mainly with readers of *The Autocar*, who are invited to write and say whether they could attend the lectures if they were held in their district. Readers in the large centres of population other than those named are asked to say if they could attend the lectures, and if efficient local support is forthcoming *The Autocar* will endeavour to arrange for the lectures in their district. The fee for the course will be one guinea.

U. Badges.
The demand for the motor cycle badge of the Motor Union is increasing since the issue of the new motor cycle prospectus. During the week ended Saturday, August 1st, fifteen badges were despatched to new members, bringing the total of the present issue of cycle badges up to 150.

Police Trap.
Three miles on the Coventry side of Dunchurch.
Record Breaking at Glasgow.
It is now several years since Harry Martin, riding a 2½ h.p. Excelsior, visited Celtic Park, Glasgow, and did some magnificent performances, establishing Scotch records which have remained unbeaten until now. On Saturday last, in connection with the sports of the Celtic F.C., Martin again visited Celtic Park and made successful attacks on his own records for one,

Results of the London-Land's End and Back Run.
At a committee meeting of the Motor Cycling Club, held on Friday evening last, the following awards were made in connection with the London-Land's End-London motor bicycle competition for the Jarrott Cup, presented by the president, Mr. Charles Jarrott: (1.) Cup, S. G. Frost (4½ h.p. twin Minerva), total variations from strict schedule, 3m. 36s. (2.) Gold medal, O. L. Summers (5 h.p. twin Vindec), 4m. 3s. (3.) Gold medal, H. G. Bell (3½ h.p. Triumph), 5m. 53s. The following who finished were awarded silver medals: E. Gwynne (5 h.p. Vindec), C. C. Cooke (3½ h.p. Triumph), V. Olsson (5 h.p. Vindec), H. R. Dougal (5 h.p. Vindec), F. G. Smith (3½ h.p. Triumph), W. Smith (2 h.p. Moto Réve), D. S. Baddeley (5 h.p. Baddeley), and W. W. Adam (3½ h.p. Triumph).

Tyneside Motor Cyclists in End-to-end Run.
In the *Newcastle Chronicle* last Wednesday reference was made at length to the splendid performances of the four Newcastle riders in the Land's End to John-o'-Groat's Trials. All are private owners and members of the Newcastle and District Motor Cycle Club, of which Mr. S. W. Carty is the hon. sec. He, with Mr. E. L. Bates, hon. solicitor of the club, was one of the two founders of the organisation, which now boasts over 100 active members. Mr. Carty has competed in the last three six days' trials on his N.S.U. with every success.

FUTURE EVENTS.

Aug. 15—Coventry M.C. Open Hill Climb for Motor Bicycles and Passenger Motor Cycles at Newnham Hill, Daventry.

" 15—Essex M.C. 24 Hours' Ride from Woodford to York and back.

" 21-22—Motor Cycle Union of Ireland Open 400 Miles Reliability Trials for the Muratti Trophy.

" 22—A.C.U. Annual Race Meeting at the new Stadium, Shepherd's Bush.

" 22—General Inter-club Meet of Motor Cyclists at Stratford-on-Avon, organised by the Birmingham M.C.C.

" 29—Essex M.C. Open 200 Miles Non-stop Run for Motor Cycles.

Sep. 1—Entries close for the Motor Cycle Tourist Trophy Race.

" 12—Motor Cycling Club Petrol Consumption Tests.

" 23—The International Auto Cycle Tourist Trophy Race in the Isle of Man.

" —Penalty Run for Members of the A.C.U. and Clubs in the South of England Districts affiliated to it.

Oct. 3—A.C.U. Council Meeting at Warwick.

Nov. 20-28—Thirty-second Annual Stanley Show.

three, and five miles. Riding a 6 h.p. Matchless racer Martin easily beat his former records, and put up new times which will take some difficulty to match. As on the previous occasions, Martin rode magnificently and aroused the enthusiasm of the crowd. Details of the old and new times are as follows: Mile flying start.—Time, 1m. 6½s. Previous best 1m. 7¼s. Three miles flying start.—Time, 3m. 24½s. Previous best, 3m. 41¾s. Five miles flying start.—Time, 5m. 42¾s. Previous best, 5m. 53½s.

The Tourist Trophy Race.
The T.T. Race for Motor Cycles is down for decision at the end of next month in the Isle of Man. Entries close on the 1st prox., the fee being £5 5s. per machine for both trade and amateur riders. In connection with this event a special fund will be opened to provide cash prizes for the winners in the two classes (single-cylinder and twin-cylinder machines), and thus induce, if possible, some of the Continental motor cyclists to compete.

W. Smith (2 h.p. Moto Réve) at Fenny Bridges. [A.C.U. 24 Hours' Ride]. Eli Clark (2½ h.p. Douglas) near Chimnoek.

A.C.U. Twenty-four Hours' Ride.

FROM an entry of thirty-five, there were twenty-nine starters in the Auto Cycle Union's annual ride from London to Plymouth and back, which started from Thames Ditton at 9 p.m. on Friday. The first check was at Guildford (15¼ miles), the second at Winchester (53 miles), the third at Salisbury (79½ miles), and the fourth at Yeovil (120¾ miles). Here also breakfast was taken, and no one was allowed to leave until 4 a.m., plus the difference between competitors' starting times and the time the first rider was despatched. Yeovil was a notable landmark for another reason, inasmuch as between there and Honiton (a distance of thirty and a quarter miles) the competitors were required to ride to a schedule of 1h. 32m. on both the outward and homeward journeys. This stretch of road abounds in steep hills in both directions.

respect, being delayed no fewer than six times. Geiger ran into a bridge and broke a wheel near Yeovil on the outward journey, and Newman going into that town had gear trouble, but effected a very smart repair. An examination showed three teeth chipped off a cog wheel. He rang up a garage and got into the workshop, and managed to set the cog up with three new teeth, and caught up with some of the other riders at Exeter. Possibly the teeth did not hold, however, as he had not arrived back at Thames Ditton late on Saturday night.

At the Turning Point.

Twenty-one riders reached Plymouth, the journey thus far amounting to 211½ miles. No one was allowed to leave again before 9 a.m. plus the difference in the starting time. Crole Rees had some

The A.C.U. Twenty-four Hours' Ride. The start at 9 p.m. (Friday) from Thames Ditton.

Three minutes grace either over or under was allowed, but beyond that riders could not qualify for bronze medals for accomplishing the double journey in twenty-four hours. There were, however, certificates for those finishing within twenty-six hours.

The starters were: H. G. Cove (4 h.p. Jap), H. M. Bentley (3½ h.p. Triumph), W. O. Bentley (5 h.p. Rex), H. V. Davidson (3½ h.p. Zenette), F. C. Wood (6 h.p. N.S.U., with sidecar), C. H. Barfield (3½ h.p. Triumph), W. H. Bashall (3½ h.p. Triumph), W. Pratt (3½ h.p. L.M.C.), E. W. Ashworth (7 h.p. Minerva), E. Nelson (5 h.p. Rex), M. Geiger (6 h.p. N.S.U., with sidecar), Eli Clark (2¾ h.p. Douglas), W. W. Douglas (2¾ h.p. Douglas), W. Smith (2 h.p. Moto-Rêve), G. L. Fletcher (2 h.p. Moto-Rêve), F. Toman (5 h.p. Laurin and Klement), W. E. Burkin (2¾ h.p. Laurin and Klement), H. A. Cooper (3 h.p. Triumph), R. H. Ratcliffe (3½ h.p. Triumph), F. Hansford (5 h.p. Peugeot), F. Cozens (10 h.p. Lagonda tricar), O. Van Saal (5½ h.p. Phänomen, with sidecar), F. W. Barnes (3½ h.p. Zenette), W. J. Newman (4 h.p. Roc), W. A. Jacobs (3½ h.p. Rex), J. P. le Grand (2½ h.p. Matchless), C. H. Crole Rees (6 h.p. Advance), G. Rowden (4 h.p. Bat), and H. O'Hagan (5 h.p. Vindec Special).

The roads were very dusty and punctures were plentiful. Barfield was particularly unfortunate in this

trouble with his valve stem at Yeovil, and later was put out of the contest through the head of his cycle breaking, and Ratcliffe was delayed with a choked petrol pipe. Barnes and O'Hagan were misdirected when near home, and went about ten miles out of their way. Only seven arrived within the twenty-four

Competitors at the Honiton control, 5 a.m., on Saturday last

A.C.U. Twenty-four Hours' Ride.—

hours, these, with their finishing times, being:

	H. M. S.
H. G. Cove (4 h.p. Jap)	8 15 18 ¹ / ₂
W. O. Bentley (5 h.p. Rex)	8 17 17 ¹ / ₂
W. H. Bashall (3½ h.p. Triumph)	8 17 17 ¹ / ₂
W. E. Burkin (2¾ h.p. Laurin-Klement)	8 19 6
G. L. Fletcher (2 h.p. Moto-Rêve)	8 19 25
Eli Clark (2¾ h.p. Douglas)	8 19 30
C. H. Barfield (3½ h.p. Triumph)	8 47 32 ¹ / ₂

Davidson arrived at 9.29, Ratcliffe at 9.48, Barnes at 9.48, and O'Hagan at 9.51. All agreed that the

course was a very sporting one, some of the hills being very severe.

There were no traps, and the police lent every assistance, keeping the streets clear in the large towns through which the competitors passed, and in which many hundreds of people gathered. The competitors spoke highly of the A.C.U. arrangements for marking the route, which consisted of Chinese lanterns by night and arrows—red to the left, green to the right—by day. The winners of the three silver cups will be announced in a future issue.

Essex M.C. Race Meeting at the Stadium.

THE annual race meeting of the above club was held on Saturday last, under delightful weather conditions, at the Shepherd's Bush track. The attendance was good, and the interest in the events was extremely keen.

Proceedings started with the heats of the five miles handicap for racing machines with engines not exceeding 76 by 76, or the equivalent thereof. Eight entries were divided into two heats. In the first, C. E. Bennett (2¾ h.p. Mansfield), scratch, and H. V. Colver (2¾ h.p. Matchless), 7s. start, and in the second W. W. Genn (2¾ h.p. Eland), 10s., and D. R. Clarke (2¾ h.p.

final. The first heat fell to W. W. Genn (2¾ h.p. Eland), 10s. start, in 7m. 4¾s., after a good tussle with F. Applebee (3½ h.p. Rex), 15s. The third heat was next run, R. O. Clark (5 h.p. four-cylinder F.N.), 10s., winning easily from A. E. Dendy (3 h.p. Centaur), 45s.; time, 7m. 2½s. In the second heat, Gordon Gibson (3½ h.p. Triumph) enjoyed 20s. start. He had no difficulty in increasing his 5s. start from S. A. Denman (4½ h.p. Brooklands), and won eventually by close on half a mile in 7m. 25s. The final of this event over the full ten miles furnished a better race even than the first. Gibson was soon away, and neither

Coming round the banking in the event for machines with 76×76 mm. engines.

R. O. Clark (4½ h.p. four-cylinder F.N.) winner of the Ten Miles Race for Tourist Machines.

New Century), 5s., qualified for the final. The heat times were 6m. 6½s. and 6m. 44½s. respectively. The final produced a good contest. Colver was the first to get into his stride, and, riding in fine style, quickly gained a lap on Genn. Bennett, too, lapped the last-named, who did not appear at all happy, and was then in turn lapped by Colver. Clarke's machine developed the sulks halfway through, letting in Genn to third place. Colver finally won by one and a quarter laps from Bennett, who was one and a third laps in front of Genn. Time, 5m. 44¾s.

The ten miles handicap for touring machines fitted with engines not exceeding 90 by 90 or the equivalent, and with a gear not higher than four to one, with 26in. wheels, had sixteen entries, six of whom failed to come to the post. Three heats of five miles were run, the first in each and fastest loser qualifying for the

Applebee (fastest loser) nor Genn could hold him. Clark's F.N., however, behaved beautifully, and a stern chase occurred for about five miles, when he drew level. For over a mile the two leaders ran neck and neck, and amidst great excitement Clark eventually drew away, and won by nearly two laps. Genn and Applebee fought together for third place, the first-named proving successful. Time, 13m. 5s.

The one mile flying start trials for racing machines proved somewhat slow, and Collier's 1m. 2s. was never seriously endangered. H. V. Colver gained first place in 1m. 3¾s., Bennett did 1m. 7½s., D. R. Clarke 1m. 14½s., G. H. Gerhard 1m. 15½s., and T. A. Carter 1m. 15¾s.

The fourth event was a one hour race for 76 × 76 racing machines for the Du Cros challenge trophy. Out of eight entries the following came to the start: C. E.

Essex M.C. Race Meeting at the Stadium.—

Bennett, $2\frac{3}{4}$ h.p. (76 × 73) Mansfield; H. V. Colver, $2\frac{3}{4}$ h.p. (76 × 76) Matchless; G. H. Gerhard, $2\frac{3}{4}$ h.p. (76 × 73) Brooklands; and T. Carter, $2\frac{3}{4}$ h.p. (76 × 76) Matchless. Colver got away badly, but quickly recovered, and started off to catch Bennett, who was early leading by 200 yards. In five minutes he had lapped Gerhard and Carter, and soon after overhauled and passed Bennett, who soon found trouble with his belt. In another four minutes Colver had again lapped the two back men. A new belt was quickly fixed for Bennett, but he was again delayed by his carburettor catching fire. A Diamond fire extinguisher on the spot, however, soon overcame the flames.

Twenty-two minutes from the start Colver gained another lap from Bennett in addition to those lost by the last named when temporarily *en panne*. At twenty-

two minutes Colver slowed, his machine developing misfiring troubles; this enabled Bennett to draw away, and in a very short time he had recovered half a lap of his lost ground. Carter and Gerhard toured steadily round with an eye to third place or the possible breakdown of the leaders. Colver's misfiring having now ceased, he was able to hold his own for awhile, and at the half-hour he led with 24 miles 1 lap to his credit, ten laps ahead of the next man.

The final placings were: 1, Colver, 49 miles 22c yards; 2, Bennett, 44 miles 1,150 yards; and 3, Gerhard, 42 miles 1,030 yards.

The meeting lasted until seven o'clock, and the ten miles record attempts by Bennett and Colver were abandoned.

Mr. Charles Jarrott acted as one of the judges, and a large staff of officials also rendered assistance.

CLUB NEWS.

Pocklington and District M.C.C.

At a meeting recently held at Pocklington it was unanimously decided to form a motor cycle club to be known as above. Members number nineteen up to time of writing. A good programme of runs, climbs, etc., has been arranged, which it is hoped will be well supported. Walter Barlow, Pocklington is the hon. sec.

Lincolnshire M.C.C. (Grimsby Centre).

On Saturday next a hill-climbing competition will be held at Lambcroft Hill, near Ludborough, at 3.30 p.m. Three classes will be included, as under: Class 1, for machines up to $2\frac{1}{2}$ h.p. (pedalling allowed). Class 2, for single-cylinder machines of over $2\frac{1}{2}$ h.p. Class 3, for multi-cylinder machines. Entry fee 1s. 6d., to be sent to the hon. sec., E. Strutt, 78, Oxford Street, Grimsby.

Southern M.C.

The first mixed club hill-climb took place at the week-end on a threequarter mile hill, which was kept secret. Results worked out as follows: 1, E. K. Davies (5 h.p. Peugeot motor cycle); 2, T. Jones (5 h.p. Antoine motor cycle); 3, J. W. Cuffley (4 h.p. Werner motor cycle). Prizes were given after the event. It was also made the occasion on which to present a silver cigar case to Mr. A. Vicars in recognition of his services as chairman.

Newcastle M.C.

The above club held a speed-judging trial on Wednesday last over a ten-mile course on the Ponteland Road. The times varied from 15 to 19 m.p.h., and out of a total of fifteen starters the first five competitors were within 42s. of schedule time. That motor cyclists can so closely judge the moderate speeds at which they are set to travel over a tar macadam road should be an object lesson for the police. The winners were: 1st, J. Daglish ($4\frac{1}{2}$ h.p. Antoine); 2nd, J. H. Douglas ($3\frac{1}{2}$ h.p. Fafnir); 3rd, Jos. P. Robson ($3\frac{1}{2}$ h.p. Fafnir).

Liverpool M.C.

The 200 miles reliability run to Holyhead and back proved to be one of the most interesting that the club has undertaken. The route chosen was through Queen's Ferry, St. Asaph, Conway, Menia Bridge, returning through Bettws-y-coed, Llangollen, Wrexham, and Queen's Ferry. The run, which was very enjoyable throughout, has helped in the neighbourhood to prove the reliability of the motor cycle. Seventeen faced the starter, and seventeen finished, and had it not been for the eighteen miles per hour limit between controls all would have been winners. The competitors' names are as follows: T. A. Clarke ($3\frac{1}{2}$ h.p. Addison-Fafnir), E. M. Brimmell ($3\frac{1}{2}$ h.p. Triumph) F. C. Jones ($3\frac{1}{2}$ h.p. Rex), Mr. and Mrs. F. Lee (7-9 h.p. Jap-Waverley), Cranston (7-9 h.p. Jap-Waverley), S. Allen (5 h.p. Waverley-Sarolea), G. Read and Pass ($5\frac{1}{2}$ h.p. N.S.U.), C. Garner ($3\frac{1}{2}$ h.p. Triumph), A. Booth ($3\frac{1}{2}$ h.p. Bat), R. Rutherford (5 h.p. Vindec), H. Brooks ($3\frac{1}{2}$ h.p. Brown), J. Bennet (5 h.p. Waverley-Peugeot), J. Bethel ($3\frac{1}{2}$ h.p. Triumph), L. Fehr, hon. sec. (7-9 h.p. Star), G. Owens (5 h.p. Peugeot), M. Lake (10-12 h.p. Humber), W. Johnston (12 h.p. Sizaire-Naudin), and C. Murdock (official car).

Five riders finished without losing a single mark, and had to run over a circular course for another 100 miles. The winners were T. A. Clark (capt.), F. Lee, E. M. Brimell, F. C. Jones, and Cranston. First prize, Cranston; second, F. Lee; third, F. C. Jones. The committee would like to thank the willing helpers.

Worcestershire M.C.C.

On Saturday last a speed-judging competition was held over an eleven mile course. Each competitor was given a different time to compete the course, and the result was as follows: T. Smith (5 h.p. Rex), winner, exact; E. Burgess (5 h.p. Rex), 15s. fast; W. Brightwell (6 h.p. N.S.U. tricar), 30s. fast; H. J. Heaven ($3\frac{1}{2}$ h.p. Quadrant), 1m. 45s. fast; G. Sanders ($3\frac{1}{2}$ h.p. Minerva), 1m. 45s. fast; H. C. Pickering ($2\frac{1}{2}$ h.p. Rex), 2m. fast; J. L. Partington ($3\frac{1}{2}$ h.p. Minerva), 2m. 30s. fast; C. A. Williams ($3\frac{1}{2}$ h.p. T.T. Triumph), 3m. 45s. fast; A. Jennings ($3\frac{1}{2}$ h.p. T.T. Triumph), 3m. 45s. fast; L. Pickering (5 h.p. Rex), 4m. 45s. fast; S. Rodway ($2\frac{1}{2}$ h.p. Kerry), 11½m. slow.

Newcastle and District M.C.C.

The annual reliability trial of the above club was held on August 2nd and 3rd to Stranraer, *via* Kelso, Moffat, and New Galloway, and home *via* Castle Douglas, Langholm, and Hawick, being a total mileage of 420 miles.

Fifteen competitors duly arrived at Stranraer, and started back next morning at eight o'clock. The first control was at Castle Douglas. The competitors then proceeded through Dumfries, Annan, and Canobie to Langholm for dinner.

Tea was partaken of at Otterburn, and all faces were anxiously turned towards Newcastle, where the trial finished at the Barras Bridge Hotel at 8 p.m.

All who had left Stranraer that morning with one exception timed in at the finish, and so concluded the largest and severest trial conducted by the Newcastle Club. The following awards were made:

First prize, N.S.U. silver cup, S. W. Carty ($3\frac{3}{4}$ h.p. N.S.U.), lost 3 marks; second prize, R. B. Smith (6 h.p. N.S.U. tricar), lost $4\frac{1}{2}$ marks; third prize (presented by Mr. E. Hawkins), Capt. Sir R. K. Arbuthnot, Bart., R.N. ($3\frac{1}{2}$ h.p. Triumph), lost 5 marks.

The club standard gold medal has been awarded to: L. Rosenvinge ($3\frac{3}{4}$ h.p. N.S.U.), J. F. Mallet (6 h.p. N.S.U.), D. M. Mallet (4 h.p. N.S.U.), A. Fenwick (5 h.p. Vindec Special), R. Embleton ($3\frac{3}{4}$ h.p. N.S.U.), S. Hudson ($3\frac{1}{2}$ h.p. Hobart), L. Austin ($3\frac{3}{4}$ h.p. N.S.U.), R. Ellis ($3\frac{1}{2}$ h.p. Rex), W. H. Outwin ($3\frac{1}{2}$ h.p. Triumph), and G. Dyson ($3\frac{1}{2}$ h.p. Triumph).

Special awards: Gold medal presented by Mr. Robson Crosier—S. W. Carty; R.A.C. silver medal, for first in passenger class—R. B. Smith; gold medal presented by Mr. S. Hudson—Capt. Sir R. K. Arbuthnot, Bart., R.N.

Coventry M.C.

Over sixty entries have been received for the open hill-climb at Newnham, near Daventry, next Saturday, including all the well-known hill-climbing experts. An interesting competition is sure to be witnessed, as the competitors will converge on Daventry from all parts of England.

Club News.—

A gold medal will be awarded for the best placing on A.C.U. formula in each class and a prize for the fastest time in each class. In addition, two prizes will be presented for the best performance by a private owner on formula and on time. *The Motor Cycle* will present a silver rose bowl for the best combined performance on formula and on time by a private owner.

All machines must be fitted with efficient silencers, two brakes, metal motor cycle mudguards, touring saddle, roadster motor cycle tyres, lamp, toolbag with tools weighing not less than 5 lbs., stand, and horn. Cut-outs will not be allowed.

The weighing will take place at Messrs. Reynolds' Garage, Daventry, between eleven a.m. and one p.m. All machines must be presented exactly as they will be ridden. No practising on the hill will be allowed.

Birmingham M.C.C.

On Saturday next the run is to Ashby; meet at the top of Gravelly Hill at 2.30 p.m. A committee meeting will be held at headquarters on Wednesday, 19th inst., at 7.0 p.m., and on the 22nd inst. this club will join in the inter-club meet of motor cyclists at Stratford-on-Avon. Mrs. F. G. Sandison has offered a prize for a hill-climb to be held on the 23rd inst. Meet Victoria Square, 10.30 a.m.

Blackpool and District M.C.C.

The results on formula of the hill-climb, held last month, are as follows:

	Figure of merit.
1. J. G. Warburton (4 h.p. Roe)	82.9
2. J. Stanworth (3½ h.p. N.S.U.)	84.8
D. Baker (3½ h.p. N.S.U.)	93.9
Dr. Reid (3½ h.p. Triumph)	96.4
W. Taylor (3½ h.p. Triumph)	102.7

Wakefield M.C.

The winner of the Triumph gold medal in the one hundred miles reliability trial to one mile beyond Leeming Bar and back to Wakefield is E. Slater. There were twelve competitors, Dr. S. Reader being second (silver medal), and T. Smith third (bronze medal).

It has been arranged to hold a hill-climbing competition on Saturday, September 5th. Particulars of the hon. secretary, W. H. Pillmore, 42, Pinderfields Road, Wakefield.

The Motor Cycling Club.

Will members kindly make a note that the hon. secretary, Mr. A. Candler, will be away for his holidays from Friday next, August 14th, until September 7th? During that period all communications to the club should be sent to Mr. R. C. Davis, Standish Gate, Southwood Road, New Eltham, S.E., who will act as hon. secretary in Mr. Candler's absence. The winner of the Jarrott Cup in the Land's End and back run will be announced shortly.

E. Slater, the winner of the Wakefield M.C. 100 Miles Reliability Trial.

A RUN ROUND THE NORTH OF CAITHNESS.

MANY of the competitors in the End-to-end competition, not content with motor cycling eight hundred and ninety odd miles in six days, spent the Sunday following the conclusion of the run in exploring the northern corner of Caithness on their ever vigorous steeds. Thanks to the kindness of Mr. R. Moore, who has won the A.C.U. "six days'" gold medal four years in succession, we were enabled to follow the example of the others, and lunch first at John-o'-Groat's and then drive the trusty Phelon and Moore on to Thurso, that quaint little town which is the chief port for the Orkneys. All along the coast the islands afford a splendid view, and serve to break the monotony of the seascape. As we leave the coast the country becomes barren and desolate, and not a tree is to be seen till Castleton is reached—a tiny village nestling in a hollow by the sea, a veritable oasis in what is almost a desert. Leaving Thurso by the inland route, the scenery is equally uninteresting until a short glimpse is obtained of the grand sharp pointed peaks of the North-western Highlands, which contrast so strongly with the tamer outlines of the Grampians as seen from the Drummochter Pass. The

road is mostly straight and fast, but is by no means flat, and the surface varies from smooth to rough.

Our mount was the identical Phelon and Moore which its designer had successfully piloted through another long distance trial, and splendidly it ran in our unaccustomed hands. First and foremost, its ease of starting and the simplicity and efficiency of its gear appealed to us. Pushing off on the low gear, freeing the engine, lazily bestriding the saddle, accelerating the engine, pulling over the gear lever to first speed, and starting away from standstill were experiences so delightful that stopping and getting under way were quite the most pleasant part of the afternoon's experiences. Up the few hills in the neighbourhood the low gear was never needed. The drive, contrary to the general ideas of chain transmission, which most people think must be harsh, was delightfully smooth, and the machine proved to be speedy as well as comfortable. The control of both the gear and engine is decidedly well thought out, especially the Bowden hand throttle, which we found to be a great comfort. Our short run left us with a still better opinion of the Phelon and Moore motor bicycle.

Numerous letters have appeared in our correspondence columns calling attention to the methods of some firms, and in a few cases invidious comparisons have been drawn between British and foreign firms, particularly with regard to prompt attention to orders. A letter which we have had an opportunity of perusing addressed to A. W. Gamage, Ltd., Holborn, E.C., is sufficient proof that this firm gives prompt attention to all business matters relating to its motor cycle department.

On a very silent car it is comparatively easy to hear when a faster and somewhat noisier vehicle is coming up from behind. On a motor cycle it is more difficult, as the noise of an unenclosed engine beneath the driver, and the rush of wind, render inaudible most outside sounds. In the recent End-to-end run the official cars, which often of necessity had to forge ahead, had difficulty in making the motor cyclists hear the note of the horn. The few men who had mirrors on the handlebar found them of great service.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Tyre Inflators.

[3469].—If "Ixion" will drill a small hole through the barrel half an inch from the cap of his tyre pump, he can then drop some oil into same and lubricate the washer, and the pump will also be found to inflate the tyre more rapidly, as the small hole, if anything, improves the compressing power of the pump.

Holders for Starting Handle.

[3470].—I should like to know if any of your readers who ride Rex de Luxe machines have any arrangements for carrying the starting handle, and, if so, if they would be good enough to explain through your columns, as I am sure it would be very useful information?

At present I carry my handle in my coat pocket, but find that it quickly wears a hole in the pocket and is also very heavy.

Perhaps the Rex Co. may have some provision on their later models, and, if so, I should be pleased to hear from them.

FREE ENGINE.

A holster made of leather or two pump clips make a very good holder for starting handle. The latter should be of the type provided with thumbscrews for fastening clip to frame.—Ed.]

The Lightweight Question.

[3471].—As I read in your valuable paper *The Motor Cycle* the interesting information about lightweights, I thought a description of my machine might be of interest. The machine weighs 68 lbs. without petrol and oil. The engine is a Clément-Gerrard 1½ h.p., fitted with a spray carburetter, which is very similar to the latest B. and B., but made of aluminium. A plain coil is fitted. The machine has a Clément two-speed gear fitted with gear ratios of 7 to 1 and 9 to 1. Chain drive. By changing on to bottom gear the bicycle can be pedalled without running the engine. It is a wonderfully powerful little engine, and will pull a cyclist and myself (weight combined with the two machines 29 stones) at 15 miles per hour, or take me singly (weight 11½ stones) at twenty-three miles per hour. The two-speed gear is a very neat contrivance, and I think if it were fitted to the existing lightweight machines that a 2 h.p. lightweight would equal the work of one of the heavy 3-4 h.p. machines in anything but speed.

E. WYATT.

Bore v. Cubical Capacity.

[3472].—For some time past a little matter has been rankling in my mind, and I should like to hear someone else's opinion about it. I suggest that the bore of an engine decides the power, irrespective of the stroke, because the piston speed remains nearly the same, whatever the stroke may be.

For instance, in an engine having a stroke of 3in., the piston travels 6in. each revolution, and taking 1,000 feet per minute piston speed gives 2,000 revolutions per minute. Again, an engine having 2in. stroke will have about the same piston speed, and therefore about 3,000 revolutions per minute. Of course, in the latter case, the gear must be lower than in the case of a 3in. stroke, to obtain the best all-round results.

Thus, in my opinion, the stroke makes very little difference to the power, provided the engine is geared in proportion to the stroke.

Again, merely fitting an engine of longer stroke does not increase the power, if the same gear is retained; the machine will be slower on the level, but stronger on hills.

Perhaps someone will explain why engines 70 by 70 are rated at 2 h.p., and 70 by 76 at 2½ h.p.

I have not missed a number of *The Motor Cycle* since it was first published.

A. W. SMITH.

Vexatious Delays.

[3473].—In answer to an advert. in *The Motor Cycle*, I sent to England on March 25th, 1908, 17s. 6d. for a variable pulley. On May 25th, not having received a reply, I again wrote asking why; sufficient time having elapsed for a reply to my second letter (I have received replies to other letters I sent to various people in England on the same date). I venture to bring the matter under your notice, as it is not conducive to the business of an advertiser if one is treated in this way. True the item is a small one, but the same principle is involved as though it was a larger amount, and the same amount of worry and annoyance is caused. I have noticed that you had occasion to publish similar complaints from people at home—i.e., inattention and delay in attending to postal orders—during the past year; but to one abroad it is more serious and vexing, as if prompt attention is given it takes six or seven weeks to receive any article from England. You might give advertisers a hint to give prompt and careful attention to enquiries or orders from abroad, and thus encourage people to send what trade they can to England, instead of letting the money drift into the hands of German and American firms, who are pushing hard here.

Capetown, S.A.

THOS. R. BUTLER.

Motor Cycle Finish.

[3474].—I was indeed interested in your leaderette on "Motor Cycle Finish" which appeared a short time ago, in which you advocated that the modern motor cycle should have fewer plated parts, and that it should be painted, or enamelled, with a more sensible colour than the present "funeral" black, which to me seems an absurd colour to use, as it shows up every speck of dirt or dust, and a machine thus enamelled quickly resembles a dust-bin after a short run on wet or dusty roads. Light French grey, to my mind, is the best colour, as a machine of this colour never looks really dirty, and it may interest some of your readers to learn that there is at present a "paint" on the market which can be applied to any part of a machine without necessarily dismantling same, and if carefully done it is difficult for anyone to tell that it had not been stove enamelled. If any of your readers care to write me I shall be happy to furnish them with the makers' name and address, which I enclose, unless the Editor will not consider it a veiled advertisement and publish same. I may say I "painted" a machine of mine with same over a year ago, and it still looks as good as when first applied, and I have specified that my new machine (6 h.p. Advance) shall be "painted" this colour.

Of course I have no interest in the firm mentioned.

CECIL H. CROLE-REES.

[We publish the name as a matter of general interest. It is "Velure," and is sold by Chancellor and Co., Ltd., Clerkenwell Road, E.C. At the same time, we do not recommend readers generally to attempt to paint machines all over without dismantling.—Ed.]

Dissatisfied Owners.

[3475].—I have read with interest the complaints from dissatisfied owners which you occasionally very justly publish, and I believe that they represent an unpleasantly large proportion of motor cyclists. I, for instance, having used a single-cylinder machine with satisfaction, ventured on the most reputable and expensive English-made twin for 1908. The assembler with whom I placed my order sent a cheque off for the engine at once. There then ensued a delay of two months, during which our agitated enquiries were met by a threat of returning the cheque, which, unfortunately, was not carried out. The engine arrived just in time for Easter, and we noticed that the external finish of the magneto gear case was very rough. The most noticeable feature of

CAN MOTOR BICYCLES CLIMB HILLS?

"You must fit one of the excellent two-speed
"gears now marketed, by the aid of which
"you can climb Sutton, and, what is more,

- "(a) climb it at a slow and comfortable pace,
- "(b) climb it every time,
- "(c) climb it twenty times running,
- "(d) climb it without any special preparation,
- "(e) climb it when your engine is below par,
- "(f) climb it when your engine is heated by a
previous 100 miles non-stop,
- "(g) climb it when it is blocked by traffic,
- "(h) climb it when it is liberally smeared with
grease,
- "(i) climb it when you are an absolute novice."

(Extract from article by "Ixion," in "The Motor Cycle,"
July 22nd, 1908.)

THE ROC WAY.

ONE TOUCH OF PEDAL
MAKES THE WHOLE WORLD FLAT.

The ROC way is the **ONLY WAY** to achieve the above results.

If you cannot afford a genuine RCC machine, you can convert your otherwise excellent machine into the ROC system with hand starting through LIVE AXLE—CLUTCH AND TWO SPEED GEAR, at an inclusive cost of 10 gns. Send for particulars.

Roc 4 h.p. Royal Military Model, clutch, gear, hand starting, etc.
48 gns.

Showing conversion completed.
Note all in back wheel—pedal levers, car control.

NOTE.—Machines sent for conversions should be consigned to our works as below, either direct, or through an authorised agent, with a label clearly indicating sender's name. Machines sent for this purpose will be generally returned within three days from receipt, tested and completed. The efficiency of each conversion is guaranteed. ANY make of belt driven machine is convertible.

LEWISHAM C.C. HILL CLIMB.Mr. H. J. BELL'S REPORT IN *The Motor Cycle*.

"Adverting to F. W. Barnes's performance on the spring frame 'Zenette,' I wish it to be distinctly understood that I leave speed out of the question in referring to his performance. This machine was fitted with the firm's 'Gradua' variable gear, and it was this gear that enabled the rider to climb the hill and negotiate the tricky S bend in a

Comfortable

way, comfortable because the speed was reasonable. It was the first time this variable gear had appeared in competition,

and it behaved admirably."

THE LUXURIOUS 'ZENETTE' AT SUTTON BANK (Yorks)

A.C.C. HILL CLIMB,

MAY 30th, 1908.

Average gradient 1 in 8, steepest 1 in 3'96.

3½ h.p. "ZENETTE"
with "GRADUA" GEAR,

accomplished another fine climb, clearly demonstrating its excellent capabilities, which was from a standing start on a gradient of 1 in 18.

One Zenette Entered, One Zenette Successful!

The only previous hill climbs the "ZENETTE" (and "GRADUA" GEAR) appeared in are

LEWISHAM C.C. (GUDHAM HILL),
ONE ENTERED, ONE SUCCESSFUL.

ESSEX C.C. (LIPPITT'S HILL),
TWO ENTERED, TWO SUCCESSFUL.

"ZENETTE" SPRING FRAME. 3½ h.p. and "GRADUA" GEAR.
Price 50 guineas nett cash. A few exchanges entertained.

"The Motor Cycle" says:**"ZENETTE" WITH "GRADUA" GEAR.**

"During the time the machine was in our hands the gear did everything which is claimed for it. To start from a standstill the engine had only to be accelerated very slightly, and when the operating wheel was revolved clockwise the drive was taken up both smoothly and effectively. In negotiating Muswell Hill by no means the lowest gear was used, and yet the machine gathered speed as it went up."

The "WOLF" is not a play-thing — it's rightly and soundly constructed with a view to high speed and hard work.

THE "WOLF"

Featherweight Motor Cycle.

The "WOLF" has a specially built frame, has an astonishing hill-climbing capacity, and is British made throughout.

The Lightest, Cheapest, and most soundly constructed motor cycle at a bicycle price.

SPECIFICATION.—Engine—A. J. Steven's 2½ h.p.; bore 2½ in., stroke 2½ in.

Coil—Fuller. Accumulator—Premier. Carburetter—A. J. Steven's automatic air inlet and throttle combined. Belt—Best Chrome. Jockey Pulley—Ball Bearing. Frame—22 in. and 24 in.

Tank—To which combined petrol, lubricating oil, and coil compartments are fitted. Wheels—26 in. or 28 in.

Tyres—Wasp No. 1, 1½ in. diameter. Made specially by the Dunlop Rubber Co., Ltd. Controls—Valve lifter and ignition are controlled by one lever; when magneto, extra lever for ignition. Handlebar—Wide raised, to which a switch of neat design is fitted. Brakes—Wasp front and back roller or inverted levers. Finish—Best black enamel, lined two colours. Olive green, silver lines, 10s. extra.

"Wolf" Tyres made by the Dunlop Rubber Co., Ltd., 2 in. to fit any standard 1½ in. rim, 20s. extra. Write for lists.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.

York and Lancashire.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, and Warwick.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

PREMIER MOTOR AGENCY,

Aston Road, BIRMINGHAM.

Telephone: 4310. Telegrams: "Primus," B'ham.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Liffé and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

'Phone: 1000 Hop.

CARS FOR SALE.

6 h.p. De Dion Populaire, two-seater, genuine licensed car; £65.—Below.

16-24 h.p. De Dietrich, five-seater, four-cylinder, magneto, four speeds, reverse; £110.—Below.

16-20 h.p. Winton, 1907 model, five-seater, side entrance, four-cylinder, vertical engine, H.T. magneto, steel chassis; £100.—Below.

24-30 h.p. Hurst, five-seater, side entrance, four-cylinder, three speeds, reverse, cardan, direct top gear; £95.—Below.

18-28 h.p. Gladiator, five-seater, side entrance, four-cylinder, Krebs carburettor, disc clutch, late model car; worth over £250, accept £165.—L. N. Palmer, 190, Mellison Road, Tooting. Telephone, 208, Streatham.

8 h.p. Horley, two-seater, three speeds, reverse, everything perfect; £47; photo.—7, Norwood Grove, Southport.

EASY Payments taken for any make car. Motor cycles and tricars taken in part payment and liberally allowed for.—Next.

SPECIAL Agent for the best little two-seater on the road, the Laurin and Klement, 6-7 h.p.; £150, including magneto, twin-cylinder engine. These little cars are absolutely reliable, and carry all before them. Write for illustrated list, and let me tell you more about them. Motor cycles and tricars part payment; easy payments or cash.—Stanton, 86, Colvestone Crescent, Dalston, London.

10 h.p. Two-seated French Car, bucket seats, Stepney wheel, perfect; £57 10s., or exchange.—Crabtree, Bridgend, Lancaster.

9 h.p. Oldsmobile, four-seater, about three years old, in very good condition; £30.—Box 503, The Motor Cycle Offices, Coventry.

8 h.p. De Dion Engine, Rothwell car, four-seater, detachable, smart, red leather, all lamps, tools, Stepney, etc.; £75.—Carr, Bury.

h.p. Automoto, three speeds, reverse, removable tonneau, seats five; £45, or exchange.—39, Hillfield Park, Muswell Hill, N.

5-6 h.p. Automotor, fast, very reliable, pretty two-seater; £30, or good motor cycle or tricar part.—Inniss, 137, St. Giles' Road, Derby.

8 h.p. Beaufort, four-seater, three speeds, reverse, Cape hood; £39 10s., tricar or motor bike part payment.—Farrar, Square Road, Halifax.

SMART, 8 h.p. De Dion Car, roomy tonneau, three speeds and reverse, excellent and perfect order; bargain, £65.—28, Woodbridge Road, Ipswich.

28 h.p. Four-cylinder Touring Car, perfect condition; £75, accept cycle or tricar in part; appointment.—J. Neighbour, 14, Dagmar Road, S.E.

5 h.p. Vindec Runabout, three wheeler, Anglian two-speed gear, magneto; 30 guineas.—Garaged at Wauchope's, 9, Shoe Lane, Fleet Street, London.

10-12 h.p. Humber, new 1907, four-cylinder, folding screen, side entrance, Stepney, and carrier, lamps, spares, etc.; £170.—Carr, Fleet Street, Bury.

DE DION-DENNIS, 8 h.p., finished brown, leather upholstery, thorough going order; trial; £45; appointment.—Stevens, 22, Mitcham Lane, Streatham.

5½ h.p. Alldays Three-seated Voiturette, two speeds and reverse, water-cooled, good running order; trial here; £20.—Hartley Clegg, Motors, Burnley.

4½ h.p. New Orleans Two-seated Car, good running order, good hill-climber; £20, good motor cycle part payment.—Riddelsdell, Boxford, Suffolk.

8 h.p. Alldays, smart light car, detachable tonneau, three speeds, cardan, equal artillery, lamp, etc.; photo; bargain, £49.—98, Potternewton Lane, Leeds.

7 h.p. Imperial Car, two bucket seats, sloping back, artillery wheels, three speeds and reverse, perfect; £28; tricar or motor cycle in part exchange.—Stevens, 4, Goldhawk Mews, Shepherd's Bush.

CARS FOR SALE.

5½ h.p. Humberette, in perfect condition; sacrifice £35, or part exchange 3½ h.p. Triumph, or four-cylinder F.N.; no rubbish.—H. Rumers, Doves, Cranbrook.

EXCEPTIONAL Bargain.—15 h.p. Ariel, in splendid running order, four-cylinder, five-seated body; inspection invited; any trial; cash £98; photo.—Alvaston Motors, Derby.

9-11 h.p. Clement, four-seater, Rothschild body, in splendid condition; £75; exchange for 6 or 8 h.p. Rover, cash adjustment.—Haigh, The Portlands, Lindley, Huddersfield.

10-12 h.p. Gillet-Forest Car, three speeds and reverse, live axle, well sprung, and in good order; nearest offer to £30, or exchange and cash.—Newark, 551, Seven Sisters Road, Tottenham.

5 h.p. Twin-cylinder Decauville Car, three speeds, gear driven, Michelin tyres, seats two; £20, or offer, for immediate disposal; in good condition.—Apply, Clarke, Chain Street, Reading, Berks.

5½ h.p. Oldsmobile, horizontal engine, epicyclic gears, artillery wheels, smart Victoria body, with hood, and detachable back seat, perfect running order, splendid condition; nearest offer to £30.—256, Burley Road, Leeds.

h.p. Quinton Runabout, two-speed gear, brand new, with bucket seat at the back, not enamelled or plated, condition as new, requires very little spent on it to complete it; price £22 10s.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

FINE Opportunity.—Pope Tribune, side entrance, 14 h.p., splendid hill-climber, seats four or five, showroom soiled only; cash, exchange tricar or cycle, or extended payments arranged; also new chassis same make.—The Service Co., 292, High Holborn.

SIMMS Tonneau Car, about 8 h.p., tonneau, four-seater, equal artillery wheels, three speeds and reverse, very good condition, and perfect running order; £35; want good open frame tricar, or twin and sidecar; cash either way.—128, High Road, Tottenham.

6 h.p. Twin-cylinder Decauville, new two-seater body, in royal blue, yellow lined, smart and light, three speeds and reverse, gear driven, guaranteed perfect; trial any time; photo on application.—Apply, King's Arms, King Street, London, N.W.

ROVER Cars. — The 6 h.p. single-cylinder two-seated Rover is the best low-priced car on the market. It is fast, silent, exceptionally reliable, and far more comfortable to ride and drive than tricars or motor cycles. We will take these in part exchange, or supply on deferred payments. — Louis Davis and Son, Moseley, Birmingham.

HOTELS AND APARTMENTS.

WHEN Visiting London stay at Waverley Temperance Hotel, 17, Euston Square. Bed, breakfast, attendance from 3s.

GARAGES.

EXCELLENT Garage, near Oxford Circus, every convenience; terms: motor cycles, 1s. 6d.; tricars, 2s. 6d. weekly.—Apply, A. Borland, 2, Lowdues Court, Carnaby Street, Regent Street, W.

BRIGHTON. — Black Lion Garage, back of Sea View Hotel, Black Lion Street, fifth turning from Aquarium, on right, along front; specially for motor cyclists; repairs on Sundays.

BUSINESSES FOR SALE.

£120 Accepted for motor and cycle business, stock, including car, good garage, and showroom, main road, no opposition; low rent.—No. 478, The Motor Cycle Offices, Coventry.

FOR Sale, one of the oldest established motor businesses in Hove, as a going concern, having a good connection, well equipped power shop (three lathes, etc.), good stock, including motor delivery van; satisfactory reason for disposal.—Apply, No. 496, The Motor Cycle Offices, Coventry.

DRIVING THEM OUT !

THE PREMIER SEARCHLIGHT (British Made.) is rapidly driving the ordinary acetylene lamp off the road. To assist to this good end, we take any old motor cycle lamp in exchange, and make a liberal allowance against price of Premier Searchlight. Send your old lamp labelled with your name, and we will quote allowance. Not one of our quotations has been declined yet. Price of lamp with generator and bracket, 30/-. Lamp only, 24/-. Three days' free trial. Light projection, 200 ft.

LOST AND FOUND.

LOST, on Saturday, 1st inst., between Leamington and Wrotham, a small waterproof roll-up hold-all, containing personal effects.—Apply, 5, Prima Road, N. Brixton, S.W.

ACCUMULATORS.

ACCUMULATORS, celluloid, speciality: 2 amp. hours; 10s.—Works, 17, Landcroft Road, E. Dulwich.

CELLULOID Accumulator Repair Outfit useful for all celluloid repairs; full directions; post free, 1s.—Osborne Works, Forest Hill, London.

VOLTOO Coils work on two volts, extremely economical and efficient; send for lists.—Ajax Electrical Engineering Co., 291, High Road, Ilford.

THE Famous Ajax Accumulator, absolutely the finest it is possible to make (see advertisement in Spring No. "Motor Cycle"); specially protected terminals; 2 amp. size will run 2,000 miles with Voltocoin.

ACCUMULATORS Repaired promptly, and make; reasonable charges, best work estimates given; full value for your old accumulator in exchange for our new "Mayfair" accumulators; special 15 amp. 10s. 6d.; 20 amp., 15s.; guaranteed one year.—Fellows, 49, Hertford Street, Mayfair.

CONTACTS.

IRIDIDIUM "Champion" Contacts, any part fitted; returned same day; 1s. 3d. each.

IRIDIDIUM "Champion" Contacts, warranted pure; trimmers for polishing iridium 9d.; no filing required.

IRIDIDIUM "Champion" Contacts. — Williams, 16, Wellington Street, Woolwich. Pure platinum fitted, to order, from 1s. 9d.

PURE Platinum Contacts fitted from 1s. 6d. to 3s.—Richardson, Church Street, Burton-on-Trent.

JEBRON Contacts, registered 291,289, vast superior to platinum; cures misfiring is reliability and efficiency.

JEBRON, best contact obtainable for blades, screws, cranks, rockers, plungers, magnetos, coils.

JEBRON, prices 2s. 6d. each rivet fitted special trimmers, for polishing Jebro 9d.; remittance with order ensures prompt attention; write for particulars and testimonials, too numerous to publish.

JEBRON Magneto Screws, complete, for Bosch magneto, DA2, will fit contact breakers 5A, 5B, 5C, 5s. 9d. pair; old screws fitted with Jebro, 2s. 6d. each; everlasting wear, requiring no attention.

JEBRON, the King of Contacts, fitted prompt return post; no delay; post free home or abroad; liberal trade terms.

JEBRON.—From the Inventor, J. Edward Brown, 38, Herbert Road, Plumstead, Kent.

ENGINES.

3½ h.p. 1908 Genuine Quadrant engine, 32 quite new; £6 19s. — Farrar, Squa Road, Halifax.

4½ h.p. Engine, tank, radiator, pump, suitable for tricar, £5; trembler coil, 1s. —Miles, Almondsbury, Bristol.

GOOD Tricar Engine, 5-6 h.p., single-cylinder, air-cooled; £5 10s.; fine condition too large for present owner.—Mellor, Grange, Urmston, Manchester.

GENUINE De Dion, 2 h.p., complete with silencer and pulley, 30s.; also 3 h.p. Whittle belt and Bowden brake, 5s. each. 69, St. Mary's Road, Prittlewell.

2½ h.p. Clyde motor cycle engine, Simon 24 Bosch low tension magneto, less carburettor; accept £3; wants overhauling. Johnson, Woodsome Ridge, Tunbridge Wells.

3½ h.p. 1905 Rex engine, M.O.V., complete with pulley, lifter, induction pump, silencer, in perfect running order; a bargain £2 10s.; Longuemare carburettor to fit, 1 6d.—Wallis, Grocer, Hills Road, Cambridge.

2½ h.p. Minerva, inclined, £3; 3½ h.p. Standard, vertical, £3 10s.; 3 h.p. Quadrant, £3 10s.; 1½ h.p. Minerva, 25s.; 3 h.p. Minerva pattern, M.O.V., £3 10s.; 2 h.p. Quadrant, 35s.; 2½ h.p. De Dion pattern, 45s.—Farrar, Square Road, Halifax.

The Judges' Report on the End-to-end.

By B. H. DAVIES.

EVERY motor cyclist should read, learn, and inwardly digest the official report of the End-to-end trial, published in the *Royal Automobile Club Journal* for August 6th. It is doubtful whether any motor cycling organisation has ever published a document of such great practical value, and its "live" qualities are chiefly due to the very thorough and frank way in which Mr. A. G. Reynolds has inspired the A.C.U. officials of to-day to treat their duties. Under various heads the report includes quite a host of valuable tips worth taking to heart for ordinary pleasure riding; the majority of these appear in the analysis given below:

Clothing Recommended.

Woollen underthings; stout tweed suit of lounge pattern; knee boots of waterproof leather (I query this detail, personally); showerproof coat and leggings, to be supplemented by an additional umbrella coat in heavy rain; celluloid collar (indispensable).

Bearings.

The judges recommend that vaseline should be melted and injected by an "oilgun" through the usual lubricator hole, the helmet oiler having first been removed. This is excellent advice. Many motor cycle bearings, especially those in the hubs and steering head, simply cannot be tightened up if allowed to become so loose that grit has been admitted. Before the trials started from Penzance two machines of excellent make had broken a ball race apiece from this cause alone, and on two or three occasions in touring practice I have had a cycle bearing work loose, and not having noticed it

till grit had found ingress, I have had to take the part entirely to pieces before I could proceed without fear of ruining a ball race completely.

Engines.

The judges report that I commented on a week or two ago, a universal immunity from engine trouble, great or small. They can find nothing more important to mention than leakages of oil on to the exterior of the crank cases in a few instances. They note that this nuisance was generally caused by loose fitting tappets. I think we may go as far as to say there is no engine that can be kept quite clean outside if liberally oiled as some of us prefer to oil an engine. What we need is a more perfect system of lubrication to prevent loss of oil, dirty appearances, and unpleasant smells.

Transmission.

The judges report no serious trouble with rubber belts, and an entire absence of trouble with the gear drive of the two F.N. four-cylinders, the chain drive of the P. and M. and Indian machines, further adding that these more rigid drives had no deleterious effect upon tyres. The conditions were all against leather belts, which necessitated much cleaning, and in several instances collected grit on their sides and wore the pulleys down badly. They emphasise the need of a better fastening joint on the round leather belts used on certain of the light-weights. This report is in perfect accord with usual experience. They omit to state whether the leather belts showed signs of a longer, if less even, existence

The Judges' Report on the End-to-end.—

than the rubber belts, and if any of the more rigid transmissions showed any signs of wear. It would have been interesting to learn officially how much, if any, the chains had been adjusted, and whether there was any looseness or noise in the bevel drives.

Tyres.

The main recommendation is in accord with a recent complaint in these columns, to wit, that tyre makers must not rest until they have remedied the chaotic condition of nominally identical tyres and rims actually differing by several inches in their most vital measurements. They opine that the tandem tyres on the lightweight machines were unequal to sustained fast running as required by this trial. They might have added that these tyres are too small to save any size of motor bicycle rim from being dented by quite small stones when struck at speeds in excess of ten miles an hour; this is my personal experience. I have found tandem tyres wear and last as well on an 80 lb. machine as the usual brand of $2\frac{1}{4}$ in. or $2\frac{1}{2}$ in. tyres

A.C.U. officials on Shap Fell watching the End-to-end competitors ascend. □

stand on a 150 lb. or 180 lb. machine; their fault, in my experience and opinion, is that they are too small to prevent inequalities in the road surface from affecting the rim, no matter whether it be a light push bicycle rim or a standard motor bicycle rim. Nor do they add that the rubber studded tyres were a magnificent preventive of side-slip, and wore a good deal better than the metal studs popular in the past.

Pedalling Gear.

These are condemned wholesale. Both chains and free-wheels were in a bad state on most machines before the end of the trials. A guard is recommended for the point where the chain passes the back tyre. My experience is that nothing will keep the pedalling gear fit and well short of a complete chain case, such as I use on my all-weather push bicycle. These are always ugly, often noisy, and generally undesirable. The pedalling gear is most needed in bad weather, and no simple means of safeguarding its efficiency has so far been discovered. This is one reason why variable gears are to be advocated so strongly. They enable us to dispense with pedals as no other device can, and they can easily be made weather-proof. The printed

report, unfortunately, entirely ignores the baker dozen of two-speed gears entered, which might have figured under several heads.

Silencers.

The judges note the undoubted fact that it is very difficult to make a motor cyclist aware of your approach when you wish to pass him. This is true, and emphasises the need of handle-bar mirrors. They proceed, however, to draw what I consider a very dubious deduction from the fact, that the difficulty arises solely or mainly from the noise his machine makes. As a driver of both cycles and cars, I unhesitatingly assert that it is generally quite as hard to make a car driver conscious of your approach as it is to warn a motor cyclist. On Mr. Levick's Napier in the End-to-end we had no end of trouble in making the competitors hear our horn (and we had three of them). On the Great North Road the other day I travelled for three miles in the dust of a 40 h.p. Napier, because I simply could not make the driver know I was waiting to pass. I personally do not wish to ride a dead silent motor cycle, nor do I think that a dead silent motor cycle will be much easier to overtake than present noise patterns.

Clutches and Pulleys.

The judges praise the free engines of several two speeders without one word of commendation for the emergency gears themselves—a curious omission, as the low gear is probably used twenty times where the free engine is used once. They wisely advocate stronger spokes for machines that are made to be started on the clutch from rest. They give adjustable pulleys some merited words of praise.

Footrests.

The report comments on the fact that long footrests of good substance averted several retirements which would otherwise have taken place through falls. One feature of the trials was the number of bent footrests at the finish—a minor damage which saved many riders from smashed contact-breakers, broken pedals, bent crankshafts, and so on.

Lamps.

"As usual, there was hardly a lamp in good condition at the end of the trials." Yes, but this year for the first time the lamps were not generally to blame. Lamps have usually but one weakness to-day and that is the hinge to the front, which is of too light construction. We need (a) much stronger brackets (b) a bracket clamp in the form of a bolt screw clean through both lamp and bracket. Friction does not give enough security for heavy lamps.

Ignition.

Praise is worthily won by the almost universal high tension magneto, but exception is taken to certain positions in which it was mounted, and to the skimpiness of the protection afforded by covers. There is no doubt now that the abaft of the engine position is the most practical, or, failing that, a cover that envelops the whole of the magneto is desirable. One rider ingeniously compensated himself for not having a magneto cover by smearing the whole of his instrument with vaseline—a tip worth knowing. I think a word of praise might have been given to the single coil, high tension distributor system fitted to the three Douglas machines, which behaved admirably, and is a distinct novelty on motor cycles.

The Judges' Report on the End-to-end.—

The report selects for special mention the Kumfo handle grip, and the 8in. flexible rubber grips on Hastings's Indian machine. I liked the latter grip immensely; the Kumfo is all right if one's fingers are unusually long and prehensile, but I should prefer a pair of Kumfo's of narrower bore to be fitted in lieu of the original exonite grips, instead of on top of them. They are not intended to fit over exonite grips.—ED.]

Ease of Starting.

The judges very wisely draw attention to the fact that a certain popular make of machine was very troublesome to start, owing to the piston being a very tight fit, and congealed oil on the whole length of its surface calling for much injection of paraffin before it could be got on the move. I do not know why one machine is singled out in this respect, as I could name three others at least which figured in the trials which always give me the same trouble when I ride them, and which I personally saw misbehaving in this respect in the End-to-end. One of them glues up pretty tightly after it has stood for as short a time as ten minutes. Doubtless the riders of these other makes were astute enough to perform their injections when the official eye was otherwhither. It is rather a sign of the times that nearly every make of machine carries a petrol squirt prominently exposed in a very accessible position. Time was when I seldom thought of a starting injection; nowadays though I often venture forth with no other weapons than my King Dick and pocket screwdriver, yet never, never, never do I leave my doorstep without my petrol squirt. I say "squirt," but the last maker I got a machine from provided me with a petrol can which in shape and size resembled a baby's bottle.

The Omission of Names.

There is one point I should like to raise, but with certain hesitation. When a bad point of any machine is referred to in this report, the machine is not named. When a good point is picked out, the machine is named. In the eyes of many sensible riders this single omission will damn the whole report; in the minds of others who do not know our judges as I know them, this omission will engender unworthy suspicions. Such a document as this judges' report furnishes a magnificent opportunity for a little plain speaking, and I cannot help feeling sorry it has been missed. My point is that all machines, even the very best, have weak points. Two things are, therefore, desirable in connection with these weak points, viz.:

1. That the makers should remedy them.
 2. That the buying public should be aware of them.
- Point 1 is, generally speaking, only obtained by *publicity*. Most makers are shockingly lethargic about correcting weak points which are not serious enough to entirely damn the machine, but are yet pronounced enough to cause customers a great deal of bother. I was just in from a run on a 1908 single tracker. It contains several minor defects, every single one of which was figured in the same firm's 1905 machine. In 1905 I wrote that firm strongly about these. I have repeated the process at various times. Every customer of theirs whom I have known intimately has done much the same; but they remain deaf and blind. Had these weak points been made public not one of them would have survived to injure their business and annoy their

customers, as is actually the case. As far as public information, which is Point 2, goes, this has a separate value of its own. I look on its main value as lying in the weight with which it reacts upon manufacturers. But two or three items in the report are of urgent personal interest to certain buyers. For instance, if a man is elderly or weakly, he reads with timidity about those machines that were difficult to start in the Trials, and wonders why on earth the make was not named, so that he might avoid it; another prospective buyer lives in a country district where the roads are bad; he wants to know which machine it was that had light rims and tyres; and so forth. In conclusion, I do not venture to assert that the judges could have given names; I only suggest that it would be of inestimable value could they see their way to do so in future.

This point concludes an invaluable practical and observant report, the honesty of the praise and the fearlessness of the criticisms being about equally marked, and the general tenour showing that, though motor cycles are very nearly perfect in point of reliability, and almost beyond blame in climbing powers, yet in the matter of absolute perfection of detail there is still room even in the pick of our market for a further advance. That advance, I confidently prophesy, is very near at hand. I have already enjoyed a few anticipatory talks with various makers about their 1909 models, and the points they are busy with cover most of the above ground, and in some instances include a few highly ingenious departures which even the fertile brains of our four ingenious adjudicators have not foreseen. I think the whole of the motor cycling community will desire to join with me in a very hearty and admiring vote of thanks to the four gentlemen whose brilliant, painstaking, and kindly labours have made the 1908 End-to-end Trial so eminent in the history of British motor cycling.

G. T. Riches and Co., 30 and 31, New Bridge Street, Ludgate Circus, E.C., send us a copy of their No. 8 catalogue containing particulars of motor cycle accessories and spare parts. The catalogue consists of 200 illustrated pages, and will be found most useful.

Mr. W. T. Smith, who rode a Moto-Rêve motor bicycle in the A.C.U. 24 hours London to Plymouth and back ride, sends us a sample of puncture material which he picked up *en route*. This consists of a piece of iron $2\frac{1}{2}$ in. long, $1\frac{1}{8}$ in. wide, and about $\frac{1}{8}$ in. thick, with several sharp edges. Mr. Smith informs us that this cut the tyre crossways and nearly severed it, sprained his ankle, and caused his retirement from the competition. Judging from its appearance, it must have been on the road for some considerable time.

Messrs. J. C. Lyell and Co., 55, Victoria Street, Westminster, inform us, after reading the correspondence on silencers which has been appearing in our pages, that they are the sole manufacturers, under license, of the Clair silencer, which won a gold medal at the Automobile Club de France silencer trials in 1907, and in the same year a gold medal at the Travel Exhibition. Messrs. Lyell and Co. supply these silencers on the understanding that if they do not give satisfaction they will refund the money to the purchaser. The silencer consists of a chamber containing a series of perforated cups fitted one inside the other.

Questions & Replies.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied with a stamped addressed envelope for reply.

Fixing a Sidecar Attachment.

?

Kindly tell me how to put a sidecarriage in proper alignment with motor bicycle? Also should the bicycle lean towards the sidecarriage at all? Should it not be vertical?—F.H.

Get a piece of wood and measure the distance from the centre of the tyre of the sidecar to the centre of the tyre on the motor bicycle; then go to the opposite side of the sidecar and see if the distance corresponds on the other side. The bicycle should be perfectly upright and the sidecar the same.

The Amount of Oil.

?

I ride a 1907 Triumph, and am puzzled about lubrication. Some say if oil drips from case when the stopper is removed that is enough, others say it should run out about half a tumblerful. Which is right, or how else is one to know?—J.D.S.

The subject of lubrication has been dealt with many times in these columns. It depends how much oil drips from the crankcase when the plug has been removed as to whether you are giving the engine sufficient or too much oil. There should always be about three pumpfuls of oil in the crankcase. You will not go far wrong if you first of all drain the crankcase, then inject three charges of oil and give the engine a further charge every fifteen miles or so, depending upon the speed and amount of hill-climbing the machine is doing. If it is working almost to its utmost, a rather more liberal supply would be better.

Excessive Petrol Consumption.

?

In March last I wrote to you as regards petrol consumption with my $3\frac{1}{2}$ h.p. Peugeot, and you advised me to try different jets, etc. My machine is now running with a jet which has only three slots in it, the remaining six having been soldered up. I cannot get more than thirty miles from a gallon. Would you advise me to fit a different carburetter, the present one is a Longuemare? My engine also gets very hot and will take hardly any air, the rings are in good order. Do you think the valves are wrong?—J.H.C., Morpeth.

It is very unlikely that all the petrol you use goes through the engine. The tank or the feed pipe unions must be leaking badly, or the carburetter con-

tinually dripping due to the level being too high or the needle valve needing grinding in. The carburetter in question is, generally speaking, quite satisfactory, and is quite economical when properly adjusted. It is quite possible that the exhaust valves may not have sufficient lift. We should advise you to check them over. The new edition of "Motor Cycles and How to Manage Them" explains how to do it.

Effect of Advancing or Retarding Spark.

?

(1.) Can you explain to me the theory of the advance spark—how it works exactly? I have an idea that in some way it causes the gases to explode earlier or later during the stroke, but how it does this I do not know. (2.) What damage is done to engine when lifting exhaust valve to slow down at corners, etc? (3.) Do you know of a little book on the theory and practice of petrol motors?—W.H.S.

(1.) Your theory is perfectly correct, but we cannot see why you do not

S. W. Carty, winner of the N.S.U. Cup in the Newcastle and District M.C.C. 420 Miles Reliability Trial.

understand it, since as the position of the spark is controlled by hand, it must necessarily take place earlier or later according to the position in which the contact breaker is set. (2.) No harm is done if valve is completely lifted, and engine does not fire. (3.) The new edition of "Motor Cycles and How to Manage Them" will give you many useful hints concerning petrol motors.

Wiring a Dry Battery.

?

I wish to add a two-way switch to my bicycle, but would like to retain and use the handle-bar switch. I shall carry a Hellenes dry battery on the front carrier, and I see that in the instructions it says wire the two + terminals to the switch, and then connect switch with "P" on coil. Shall I do any harm by using two switches, i.e., the double one to make connection with either battery, and the handle-bar as an "on and off" switch?—E.W.P.

There is no reason why you should not use two switches, or you can use a two-way switch for that matter. It really does not matter whether the negative or the positive is connected to the coil, as it only has the effect of sending the current the other way.

An Accidental Cure.

?

My engine is a $3\frac{1}{2}$ h.p. White and Poppe. For many months I was troubled with popping in the carburetter. I tried stronger inlet springs (m.o.v.), trembler adjustment, etc., all to no purpose. When running slowly, and especially when the load was off the engine and the spark retarded there was generally a regular fusillade going on in the carburetter, somewhat bettered by shutting off extra air. My theory was that the incoming charge was ignited by the fired one, although the exhaust valve had the proper lift, but I don't think I can be right because the cure I stumbled on does not have any relation to it that I can see. I found my piston rings so worn that there was no spring left in them, and so had new ones fitted. This done the trouble disappeared. Can you account for this cure?—A.R.R.

We can more or less account for the cure. The carburetter was originally adjusted to give the correct and proper mixture, but as the piston rings and other parts became worn, and the compression failed, the suction, of course, decreased and less petrol was drawn through the jet, with the result that you could not close air-holes sufficiently to cause a strong suction around the jet, and the mixture was too weak to explode properly. Had there been any range of adjustment on the fixed air inlet, you would have been able to obtain an explosive mixture by partially closing the apertures.

Causes for Loss of Power.

What is the likely cause of a general loss of power in a 1904 3 h.p. motor bicycle? It has a B. and B. carburetter, and 5 to 1 gear, but I am unable to get more than thirty miles per hour out of it, and the gradients it sails on are not by any means steep, that is, unless I pedal. I bought the machine second-hand three months ago, and at that time it was running well. Any tips I shall be glad of.—B.B.

Loss of power in an old engine is usually due to weak compression, reduced lift of valves owing to wear of valve cams, and to wear on the firm cam. If you have the cylinder reamed by a first-class firm, new piston rings fitted, and cams replaced if necessary, the engine would give off as much power as when new.

Concerning Coil and Carburetter.

I was testing my coil on a brick wall and had one hand on the wood case. I touched the negative terminal with the other, when I received a fine shock. Is this correct? My only solution is that the wood case was damp. Would there be any loss of current while the coil is on the machine? I am leaving the coil in the sun to dry it out if that is the case. How is it that when running at thirty-five miles per hour I can close the throttle and give more air than when machine is running at fifteen miles per hour? I cannot understand that at all. The carburetter is an Amac. Have you had any experience with this article? I propose boring some small holes in the induction pipe if you advise it.—M.E., S.W.

The shock you speak of might probably have been due to the case of the coil being damp. Owing to the greater suction there is a greater suction on the valve, and more petrol is drawn through. The carburetter you are using is a good one. If the engine will stand it, a few holes in the induction pipe which can be covered by a clip when starting or running slowly, or better still an ordinary compression tap screwed in the induction pipe, will make an efficient extra air inlet, but it is unnecessary on a single-cylinder.

Another Case of Excessive Petrol Consumption.

I ride a 2½ h.p. Kerry with Longuemare carburetter No. 74152 (but no other marks). My usual distance on a gallon of petrol is absurd, viz., thirty-five miles. I have tried all remedies, such as throttling, admitting full air, etc., but even then cannot run with any more success, and at times have to reduce the air. The carburetter appears far too large for the work it is required for. What would you advise? The carburetter is in first-class condition. I have had the float adjusted by a mechanic.—W.P.

You state, the consumption is perfectly ridiculous. Your machine should run regularly between 80 and 100 miles to the gallon. The petrol level should come to within ½ in. of the top of the tube into which the spray screws.

You can alter the level by shifting the position of the weight upon which the float rests on the needle valve. Use as small a jet with as large a choke tube as you can. The machine should only take full air when running at full speed. If the carburetter drips or floods in any way the consumption is bound to be excessive. The needle valve probably requires grinding in. Examine carefully the tank joints and unions; we are inclined to think there is a leak somewhere.

READERS' REPLIES.

¾ in. Belts on 3½ h.p. Bicycles.

In reply to "A.C." Southsea, in Questions and Replies, I notice you say, "Nothing less than a ¾ in. belt will stand for long." I have a heavy 3½ h.p. machine, and I was in the same fix, the pulleys only being ¾ in. After trying several good makes of belt, which all pulled out at the fastener, I fitted a ¾ in. Whittle link-grip which has now run considerably over 2,000 miles without any trouble, and without showing signs of wear. I may mention I am in no way connected with the firm.—A.S.

Plugs for Magneto and Battery Ignition.

With regard to sparking plugs, which are equally suitable for magneto and accumulator ignition, I find the Pognon the best I have ever tried. I have two in my engine, and but for cleaning the points a few times, caused by over-lubrication, I have not needed to take them from cylinder. As regards magneto spares, a complete contact breaker is by far the best for quick repair of any ignition trouble.—CY 510.

One Cylinder Firing in the Silence.

In answer to "J.M.D.'s" query in your issue of the 22nd ult., I had the same trouble with my twin-cylinder Minerva. Upon examining the engine I found that there was not sufficient clearance between the exhaust valve and tappet of the cylinder which did not fire. This would not allow the valve to close properly, thus causing explosions in the silence. After filing the exhaust valve stem the cylinder fired perfectly. I may mention that my machine is fitted with coil ignition, so perhaps the cause of the trouble in "J.M.D.'s" machine is the magneto, as you suggested in your answer to his query.—H. D. HELLIWELL.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Running on Naphtha.

[3482.]—I notice in your issue of July 22nd a letter signed Cyril V. Albrecht. As I and others are much interested in the subject of using crude naphtha, it would be of great interest to many to know where your correspondent gets his supply, as from enquiries I find his statement of 4d. or 5d. retail quite misleading from the address he names.

S. STIMPSON.

Hill-climbing.

[3483.]—In a recent issue of *The Motor Cycle*, re the climbing of Clay Bank, Mr. Raper is not the only one who has achieved this feat upon a motor cycle. I climbed the hill in 1906 on a 6 h.p. air-cooled Quadrant Carette minus passenger, and also upon a $3\frac{3}{4}$ h.p. two-speed gear N.S.U. motor bicycle. Also I climbed at the first attempt the celebrated Sutton Bank last year (June 30th, 1907) on the same $3\frac{3}{4}$ h.p. N.S.U., after riding straight through from Durham, and was witnessed by three gentlemen, who gave their signatures for verification. As Mr. Raper says, it is nearly impossible to remain seated in ascending Clay Hill, owing to the vile surface and the gutters across the road.

J. W. LUCAS.

Front Wheel Stands.

[3484.]—Why not the following for a front wheel stand? By having the stand on the front fork the front wheel would be fixed. Why do not makers put a lock on motor cycles for fixing the head? They are invariably put on pedal cycles. Also I have never seen any motor cycle that has proper lubricators whereby the steering socket bearings can be oiled. To those who find the ordinary wallet too small for

A. Metal rod. B. Ring.
C. Screw for fastening A.
D. Clip for front fork.

spares, may I suggest a wickerwork hamper lined with American cloth?

A. B.

Front Fork Breakages.

[3485.]—Regarding the breakage to front forks, I have been unusually unfortunate in this respect. Twice I have had one blade break off on an ordinary pattern fork, once one of the three girder plates forming the crown of the same forks broke, and only recently I had the misfortune to break a fork, on a $2\frac{1}{2}$ h.p. machine, at the root of the steering column, just flush with the bottom ball-race, in this case having girder forks of the pattern perhaps most common—i.e., fastened to head locking clamp at top and wheel spindle at bottom. In the last case I heard a snap, and was fortunate enough to dismount before the wheel came out of place, but soon after dismounting the girders simply swung out on their top bolt and let the engine down on to the road with a bump.

Arising out of this, I should like to know if any of your correspondents have seen or designed a girder fork which will not do this. It would also be interesting to know what the general opinion is as to whether or not spring forks minimise risk of breakage, or reduce vibration without really lengthening the reasonable life of the fork proper.

INTERESTED.

[Spring forks undoubtedly minimise, if they do not absolutely prevent, breakage. Trussed girders will hold machine and engine up if fork tube breaks.—Ed.]

An Enclosed Magneto.

[3486.]—"Ixion's" remarks re position of magneto open up a very interesting subject. On most machines a delicate and vital part is exposed to both rain and mud. Placing the magneto in the tank adds unnecessary weight, whilst it is placed behind the engine, rain can still get to it. I would suggest, as an improvement on these, placing the magneto in a special case cast in one piece with the valve side of the crank case. The rough sketches 1 and 2 will illustrate what I mean. A is the magneto case with the

Fig. 1.

Fig. 2.

magneto B in position. The cover E would be part of the gear case cover from the engine. The cover C, held in place by the bolt D or other means, would allow easy access to the contact breaker, and absolutely keep out all mud or water. The rod L would move the contact breaker, and the bearing could be oiled by means of the lubricators and tubes H. The wires could be taken through vulcanite bushes placed in any convenient part of the case. The magneto would then be a fixed part of the engine, and thoroughly protected against the weather or a fall. Fig. 1 shows the idea applied to a twin-cylinder engine, and fig. 2 a section through the case.

A. S.

Hill-climbing in North Wales.

[3487.]—A friend and I have lately returned from a tour in N. Wales. The machines were 6 h.p. twins, mine being fitted with the Nala two-speed hub. Our idea was to explore some of the lesser known side and cross roads, as well as the main ones, but we soon gave it up, and have now great respect for Welsh roads. The single-gear twin with a 4 to 1 gear proved a total failure at the work, although it will take hills such as Muswell or West Hill, Hampstead with a gear of $3\frac{1}{4}$ to 1. My own machine with gears $3\frac{1}{2}$ and 7 to 1 proved equal to anything we came across, and in one instance towed the other machine over a bad knuckle when it came to a stop. In a good many cases gates were the trouble, and it took our united efforts to get the machine away again or to push it up to an easier starting place. Anyone riding alone or with another single-gear machine would have a bad time.

If anyone wants to try a hill which is worse than Sutton Bank he should try the road from Bettws-y-Coed to Cap Garmon; there is only one gate, and an easy start beyond it or the one from Penmachno to Festiniog. The latter provides a little practice at gate opening, as there are five on the hill, on various grades from 1 in 6 downwards. Mine is the only machine that has been up either of these hills, far as I can discover. The contact breaker on my twin "Ixion's" ideal one, I think; the only adjustment required is to see that the single pair of platinum contacts are exactly opposite, and they are then allowed to wear out without any further attention; they will last about 2,000 miles, and with a slight alteration the contact breaker can be used, if necessary, without any platinum at all for a further 200 or 300 miles. It would fire four, six, or eight cylinders with the same pair of contacts.

R. MEESOM.

Silence.

[3488.]—*Re* silence, are not the makers chiefly to blame? The majority of machines are still turned out with very inefficient silencers, and it is hardly to be expected that the riders will go to the additional expense of replacing them. I should have thought it would have been to the makers' advantage to turn out quiet machines. Noise is responsible for much of the ill-feeling against motor cyclists. Noise frightens off many would-be riders. Noise is the cause of many a headache and "tired feeling" in those who do ride. Noise attracts an undue share of police attention, and may possibly have something to do with the excessive fines. Noise has turned the motor cycle from Brooklands. What other restrictions are awaiting us?

I daresay my experience is not exceptional. Having to return my bicycle to makers for repairs, I asked them to fit one of the good silencers on the market, or make me a new one (of course, at my expense). They made me one consisting of a couple of tins slipped over the exhaust pipe, outside dimensions 3½ in. by 2½ in. (2½ h.p.) Result: My machine was as quiet as a Maxim gun in action. People would rush into doorways or cling to walls like limpets until I had passed by. Is it good for the pastime or the industry?

THE GALLOPING MAXIM.

The Rival Belts.

[3489.]—Might I suggest to those who are so warmly advocating the rival claims of rubber *versus* leather belts that both have good points, and that the wise rider who wishes to get the most satisfaction and value for his money will provide himself with one of each kind for use as circumstances permit. So far as my experience of each kind goes, I find that nothing gives so nice a drive or so little trouble as a good leather belt in fine weather or under conditions where it is not exposed to a soaking treatment. It will stand a day of this without damage, but then wants dressing and drying, whereas mud and rain have no bad effect on rubber belts at all; neither does the grit get into them and cut out the pulleys in bad weather.

Although the rubber has this advantage under adverse conditions, it has nothing like the life of a good leather belt. It is the exception to get a rubber belt to stand over 2,000 miles—many give up the ghost at a very insignificant total—whereas a good leather belt has a long life. For instance, I used on a light tricar a ¾ in. Watawata belt from the Sunday after Fernhurst in 1906 until September, 1907, running nearly 6,000 miles, and a portion of this belt is still in use in my mills driving a machine running all day long. I replaced this belt with a double ply of the same make, which I have now driven close on 3,000 miles, and recently, when it was so wet, I used it for 507 miles, including a portion of the Peak District of Derbyshire, without trouble. All I did was to take up ¼ in. at Chesterfield (on the fastener), and twice I oiled the belt before starting in the morning. The load it has to pull is about 5½ cwt. I have no pedals, and passenger only got out on one hill. As it rained nearly every day, and on one occasion machine was in water up to the

top of the sparking plug, the test was a severe one, but the belt appears no worse.

As regards frequency of tightening, I may say that I took it up on Easter Monday, ran nearly 1,200 miles, and again shortened it on Whit-Monday, the next tightening operation being the one at Chesterfield.

This should prove to some extent that all leather belts are not masses of slime and oil. Did users more frequently dress their belts with the proper oil, they would stand much better. A slipping belt can often be cured, especially in wet weather, by well oiling it. The same applies to a belt that is dry and shiny. Mere indiscriminate tightening of a belt soon leads to its destruction. In good order, a ¾ in. belt will transmit enough power to propel a passenger combination when quite slack, but if the pulleys are not correct or the belt in good order 1 in. will not give satisfaction. One thing is certain: no chain would ever stand anything like the bad treatment belts receive.

A. C. PEMBERTON.

Standardisation of Rims.

[3490.]—I am very glad to see that Mr. B. H. Davies has again taken up the question which I started over two years ago on the standardisation of rims for motor cycle tyres. No one but the manufacturer, who is anxious to supply any tyre a customer may desire, knows the great annoyance that is caused by different makes of tyres requiring special size rims. The only way to overcome this difficulty is for the manufacturers of motor cycles to get together and adopt standard size rims; and insist upon the tyre manufacturers supplying tyres to fit these rims. On Vindec Special motor cycles this year we have as far as possible fitted what we call our standard rims for 2½ in. tyres, which measure exactly 22½ in. outside diameter, and we have found that Michelin, Dunlop, Goodrich, Clincher, and the special Palmer Cord tyres fit this size rim perfectly. There are other makes of 2½ in. tyres which with considerable effort can also be forced on to this size rim, but of course they are not a perfect fit. At the same time, if you were to compare the makers' sizes and the tyres mentioned you would find a variation, both below and above our standard, of possibly ¼ in. For a 2½ in. tyre a 22 in. outside diameter rim should be used; any smaller rim than this does not permit a 20 in. belt rim being fitted.

The Motor Cycle would certainly be doing, not only motor cycle manufacturers but the motor cycling public in general, a good turn if they would follow up the matter in regard to standardisation of motor cycle tyre rims.

W. H. WELLS.

[We went into the matter very carefully some time ago, and published an article under the heading of "Interchangeability of Tyres" on May 22nd, 1907, page 409. In this article we particularly emphasised the fact that the correspondence with and personal calls upon the leading tyre makers had not elicited the information we desired, viz., which makes of tyres are interchangeable one with the other. Although all the makers were most willing to give every information regarding their own tyres, they were extremely reticent respecting other makes. After all, this is perhaps only natural.—ED.]

Meet of Scottish Motor Cycle Club members at Stirling on the 8th inst.

Belts and their Fasteners.

[3491.]-In the case of rubber belts, the following is the way I prevent my fasteners from pulling out. Take a piece of ordinary bicycle chain and hammer the rollers out. The sides will then be loose. Take one side plate and place it on the top of the belt, just under the fastener, so that the screw will go through the fastener and also through the side plate. Drill another hole through the belt to correspond with the other hole in the side plate, and put a small bolt through and secure it with a nut on the top of the belt. It is advisable to put a small washer on the bolt, so that the head is not drawn into the rubber. The belt will require shortening before the fastener shows any sign of pulling out so that the bolt can be taken out, a piece cut off the belt, and the fastener screw can be put in the hole originally occupied by the bolt. AJ 223.

Record Lubricating.

[3492.]-Will "Ixion" forgive me saying so, but I see nothing extraordinary in his so-called record published a few weeks ago. Some two years ago I wrote you on the subject, assuring your readers what I can do, and do do, on a $3\frac{1}{2}$ h.p., and I have proved long ago that most riders of motor bicycles over-lubricate.

Without a doubt, "Ixion" need not "wonder" if the B. and B. carburetter has anything to do with it; of course it has. If everyone adjusted their carburetter perfectly, this overheating question would not be the source of worry it is.

I am sure I do not use half the oil others do, and for four years now I have had no troubles with my engines. The one I use now has not been dismantled since new, some fifteen months ago, and when I do take it down I expect to find only very little carbon deposit, in spite of using it nearly every day. EXPERIENCED.

Footrests v. Pedals and Stands.

[3493.]-"The time is surely near when pedalling gear may be dispensed with on first-class powerful modern machines."

The above quotation points to a landmark in the transition period from pedals to footrests, which may be illustrated by way of question and answer:

Define a motor bicycle? A mechanically-propelled single-passenger road vehicle.

Define its functions? A means of transit (in pursuit of pleasure or business).

As a designer partly responsible for the introduction of the footrest idea, I am pleased to see the point now timely expressed by "Ixion" as to a safe road clearance. Footrests should have at least 7in. road clearance; at this distance they are infinitely less dangerous than pedals, which on some machines leave barely a 3in. clearance. But the controversy now awaiting settlement is pedal assistance v. auto-propulsion proper. The advent of the variable gear surely settles it. The partisans of pedals who have a propensity for physical exercise may be reminded that a course of Sandow culture at home is likely to be more beneficial and less ludicrous than the display of a perspiring and distorted countenance amid the scenery of country lanes and roads.

The suppression of pedals tends to bring about the abolition of the stand, for surely it is more convenient for cleaning or tyre repair to incline one's machine on the footrests! The process of jacking up the back wheel and pedal persuasion to start an engine instead of a comfortable hand turn through live axle is as unnecessary as it is irksome and undignified. No; as an eminent author once remarked, "The existence of pedals proves the weakness of a motor bicycle." They have a proper place on push cycles; I notice they are even admissible on the pedal-propelled gondolas at the White City. Their retention on motor bicycles is prejudicial to that low, comfortable, safe position which alone will prevail.

ARTHUR W. WALL.

Leaking Batteries.

[3494.]-Referring to Mr. R. N. Morley's letter [No. 3446] in July 8th issue, as a brother motor cyclist I would like to say that I, too, have suffered inconvenience both with cycle and car batteries.

Accumulators in the first instance are costly if you get good ones, they want constant watching, recharging, and replenishing with acid, they run down whether in use or not, and after a time the joints at the top open, acid oozes

out and trickles down, spoiling the enamel or paint work, and rotting everything with which it comes in contact.

What a job, too, to keep the terminals clean; I have had much trouble that way, so have discarded accumulators altogether, and adopted dry batteries, which have given me every satisfaction.

I wrote to Messrs. Siemens Bros., Ltd., Woolwich, who very kindly made me a battery of three cells in one case giving 4.5 volts, which has been very satisfactory. It was not a stock size, but made to give as large a battery as the space would admit. The price is so small (only the cost of charging a leaky accumulator a few times) that it is a wonder to me that more is not heard of these batteries.

I have recommended them to several friends and acquaintances, and at the present moment Messrs. Siemens are making one to dimensions for a cyclist friend of mine, who, like myself, is tired of leaky batteries.

If Mr. Morley writes to this firm for their booklet on "Ignition Dry Batteries" he will find a short article written expressly for motorists which I am certain will interest him.

He will find there is no need to watch a dry battery. While standing it recuperates itself, no acid to spill, no corroded terminals, and no running about to get it charged.

I was told by the makers that I might expect fully from 2,000 to 3,000 miles from my battery. I have not done that distance yet, only riding my cycle occasionally, but if at the end of the season it gives out, the price is so small that it can be thrown away and a new one purchased.

In conclusion, I would like to add that I am in no way connected with Messrs. Siemens, Ltd., except as a satisfied user of their ignition dry battery. A 5756. A 6340.

[3495.]-Having derived much benefit from your paper, I thought my experience might be of use to some of your readers.

I used to use accumulators. My coil never exceeded twenty miles without sticking. The acid used to splash out, and they always wanted recharging when I wanted to go twenty or forty miles. The last, a well-known 20 a.h., both plates broke in about 300 miles. Nine months ago I bought a Hellesen dry cell (Flash). Since then I have rarely had to adjust my trembler coil (Guénet), which I was told would soon run it down. I have now been about 1,000 miles on one dry cell, and it is still at work.

WILLIAM C. CRAWLEY.

Adjustable Pulleys.

[3496.]-I do not know whether other riders have had the same experience as I have, but after three years' use I have come to the conclusion that the only satisfactory adjustable pulleys are those which have a sliding flange. A flange that is screwed the same way as the locking ring, as in the old Greenwood pulley, was tolerable, though even this was a nuisance at times, but a flange that is screwed with a left-hand thread against the ring's right-hand thread is, to my mind, wrong. Personally, I would recommend all users of the latter type to discard them before they break up their bearings in an attempt to unlock the locking ring—that is to say if they can get them off!

Having broken an otherwise unbreakable ball bearing, I am speaking from hot and bitter experience, and while the makers know what I feel, I wish they could only see the array of racked and twisted spanners I have used on their "patent adjustable pulleys." AM 675.

[We think our correspondent must use too much force in tightening the lock ring, as we have experienced no real trouble in this direction with right and left-hand threads on lock nuts.—Ed.]

MOTOR CYCLING IN ARGENTINA.

E. W. Brown writes that he will be pleased to give readers any information they require regarding motor cycling in Argentina. Letters addressed to him, care of the Editor, will be forwarded to the right quarter.

EXPERIENCES WANTED.

"Spark."—Of the roads to avoid in E. Riding of Yorkshire S. P. (Mon.) would like readers' experiences of the Gillett-Lehmann carburetter control.

OCCASIONAL COMMENTS.

By "IXION."

A Plethora of Belt Fasteners.

I desire to return thanks to the numerous patentees who have sent me sample belt fasteners. Their number prevents me replying individually, and the same misfortune will also prevent me from completing my tests for a month or so. A great deal of ingenuity is evidently at work, and so many brains should eventually produce more than one good fastener between them.

Lightweights in the End-to-end.

Mr. B. H. Davies commented a week or two back upon the novelty of seeing lightweight machines well up with the leading competitors in the A.C.U. Trials, and averaging legal limit. He failed to comment upon a fact which was at least equally obvious, and that is that, gallantly as the lightweights indubitably performed, they failed to show the same high level of efficiency as their heavier rivals. A large proportion failed from one cause or another to finish, and of those which reached John-o'-Groat's House, none secured a gold medal. I admit they would have made a better show had the conditions not been exceptionally arduous during the trial; and while we welcomed this for the magnificent opportunity it afforded other machines of surmounting difficulty, it certainly was arrant bad luck that the roads and weather should have proved so adverse in the first year, which welcomed a large team of 80 lbs. machines to the A.C.U. Trials. One thing was proved, and that was that the engines fitted to these lightweights are all right; and, after all, when the engine is right, there is little more work to be done before a sound machine can be turned out. The imperfections of the present lightweights vary with the make, but, as a rule, tyres, rims, wheels, belts, and detail fitments generally leave a little to be desired. These points will be tremendously improved by this season's experience and failures, and if the trials next year are lucky enough to get fair weather, I expect to see a whole fleet of lightweights win gold medals, while two or three firms, such as the Motosacoche and Moto-Rêve, will get a complete team through, if, as I hope, they see their way to enter three machines apiece.

Belts and Tyres on Lightweight Machines.

I do not profess to be specially enthusiastic about the lightweight motor bicycles of to-day, whatever ardour I may be able to summon up about those of to-morrow; and consequently my words may be a little jaundiced. But in respect of tyres and belts many of them strike me as undesirable resurrections of faulty details buried about the year 1902. About that date I rode or owned several machines only a few pounds heavier than the lightweight of to-day. Those machines were as strong uphill as the modern 80 lbs. machine, much as their 1908 relative surpasses them in comfort, carburation, ignition, and mechanical reliability. But my main troubles with those early lightweights were confined to the tyres and the belts. The tyres were soon worn out, easily punctured, and too

small to prevent quite small stones from kinking the rims if struck at normal motor cycling speeds. The belts were also a fruitful source of trouble, owing more to the low gear than to their tiny section. Consequently before I again become a regular and contented rider of lightweight machines I must stipulate for a specification excluding what are only push-bicycle tyres, rims, and wheels under another name, and which does not force upon me once again the abomination of a twisted round belt, or, alternatively, of a stiff V belt, gripping only half the circumference of a 3in. engine pulley. And of the lightweights I have tried, few promise me any secure immunity from those loathed annoyances of bygone days. I have just returned from a short run in hilly country on what I suppose to be the best of the modern 80-pounders. I have had two

Gold medal winners in the Manchester M.C. non-stop run to Cheltenham and Back. From left to right the riders are: W. Heaton (5 h.p. Rex), H. Reed (4 h.p. Dot), O. Gros (4½ h.p. Eagle), J. Tytler and C. E. Kettle (3½ h.p. Triumphs).

punctures, and both wheels are buckled. The belt is made up of odd lengths and fasteners, and even now is slipping so badly that I had to assist it with the pedals down my own drive.

Special Hill-climbing Machines.

One or two correspondents have written to ask what deviations from standard specification have been made in the one or two cases where "tourist" hill-climbing events have been carried off by special machines. I can only speak from personal knowledge of one or two such cases, and in these instances the special points of the machines were general reduction of weight throughout, the use of a far higher compression ratio than is employed for the same firm's roadster machines, and the use of ball bearings for the crankshaft and connecting rods, whereas the standard mount had plain bearings. I may remind readers that the building of these special machines does their inventor no manner of good whatever, for if the motor cycling public see that these remarkable performances are solely produced by a single man and a single machine, instead of being duplicated by private customers, they naturally smell a rat. Consequently the trade as a whole have ceased to seek advertisement of this particular kind, and many concerns never for a moment countenanced any such tactics.

HOW WE CLIMBED GLENFINART.

PROBABLY readers of *The Motor Cycle* may still remember the entertaining account written by Mr. Maitland of a hill-climbing tour he undertook in the Western Highlands of Scotland, and of his rather distressing experience on a certain hill, viz., Glenfinart. Mr. Maitland made the assertion that no motor bicycle could climb Glenfinart, even with a two-speed gear. With this statement I disagreed, being aware from personal experience of the capabilities of my two-speed 5 h.p. Vindec.

Hugh Gibson, the writer of the accompanying article.

Another writer, "Argyllshire," also doubted the ability of any motor bicycle to accomplish the climb, and remarked that were any machine to do so the makers would be kept busy with orders from Scottish riders alone.

Accordingly a friend and I decided to attempt the climb. B.'s mount is a standard 1908 Triumph, with a slightly larger jet and a few additional airholes; gear, $5\frac{1}{4}$ to 1. My machine is a 1907 5 h.p. Vindec, two-speed gear, with handle-bar control and Watawata belt; gear, $4\frac{3}{4}$ to 1.

In order to reach the hill in tip-top condition, we took the steamer from Glasgow to Dunoon, which is a cheap ride at 1s., and I strongly advise this route to anyone desirous of reaching the hill quickly.

Worse than Sutton Bank.

We left Dunoon, and soon covered the fourteen miles to the Glen, *via* Kilmun and Ardentenny. B. was ahead, and went tearing up the Glen for a quarter of a mile before he found his engine was slowing, and that we had already climbed part of the famous hill. After studying the map and making certain of our position, we jacked up our machines and took a stroll upwards. At each bend our spirits became more depressed, and when we saw the awful left-hand turn on a gradient of about one in five or one in six, we agreed that Mr. Maitland had not exaggerated the hill in the least. It is the worst hill we have ever seen, and eclipses Sutton Bank, the surface on the bends being vile. B. christened the last corner "Hell's Corner," and this is a very appropriate sobriquet.

At this stage B. was prepared to struggle up in three

rushes, whilst I thought that my two-speed gear would at last get a chance of proving its worth. We no longer returned to the foot of the hill and detached all our luggage, but kept our machines equipped with tools, roll, lamp, and horn, whilst I also left my spare tools, bag and tubes on the machine. Its weight though equipped is 265 lbs., my weight 9 stones 3 lbs.

B. having divested himself of several articles of apparel, decided to make the first attempt, and, as I was being ready, I gave him a hearty push-off and shouted out "Good luck!" The Triumph was picking up a pace the way until I lost sight of machine and rider, and there was a sudden silence as they disappeared round the corner.

Successful at the First Attempt.

I was alone for ten minutes or more, when I suddenly saw a strange figure approaching, and a closer inspection proved this to be B., minus leggings, coat, vest, and other small accessories. His face was red, but he wore a radiant smile, and he had every reason to feel happy, since he had climbed to the top of Glenfinart at the first attempt. Of course, some pedalling had been necessary, but even then it was a splendid performance to climb a strange hill of the calibre of Glenfinart. B. remarked facetiously that if he had been shaved, put on his slippers, and left his only cigarette with me, he might have gone up a good deal faster. We longed for a "Bar," or even a stone ginge, but these luxuries are not to be had on Glenfinart. The sun was in his glory, and we perspired freely, B. reducing himself by at least 3 lbs.—at least that was what he worked it out at (1 lb. per hour).

On my first attempt up Glenfinart the Vindec pulled well, and after getting round the first bend I had to switch off twice in taking the left-hand turn. I was going up well, and accelerated my speed to about twenty miles per hour as I rushed at the last awful

J. H. Brereton, the writer's companion.

corner. I was travelling too fast to get round, and I snatched in the low gear rather too sharply; the front wheel swerved, struck a boulder, and took me into the gutter on the left-hand side of "Hell's Corner." My heroic attempt to get out of the gutter failed. I stopped within an arm's length of the top

How we Climbed Glenfinart.—

The indefatigable B. had now arrived with the luggage, and I went back some two hundred yards to try and pick a track round the last corner. My belt was slipping, so we took it up, and B. marked out a track for me to follow. There is only about eighteen inches of hard surface on the corner, and unless one can keep on this strip a skid is bound to take place.

Another Attempt Successful.

We had both long since reached boiling point, and it was agreed that my next attempt from the bottom should be the last before lunch. B. could not help thinking of Whistlefield Inn, so I promised that this time I would take great care on his pet corner and sail up to the top. I coasted down to the foot of Glenfinart, and after seeing that I had a reserve pumpful of oil at hand I started off once more. The engine pulled better, and, owing to the tightened belt, seemed to climb better; no pedalling was necessary, but I decided that I would go round "Hell's Corner" on the low gear to obviate any chance of skidding. There is nothing more to add, save that I changed down from high to low so imperceptibly that B. never knew at which point I had changed gears. The Vindec next took up our luggage, and we made a quick run down to Whistlefield Inn.

After a well earned rest we set off for Arrochar *via* Cairndow and Glencroe, but we missed Cairndow, and got on the famous pass before we were aware of the fact.

We had ridden some twenty miles, but did not stop many minutes before tackling the famous climb over Glencroe.

A large car a mile ahead was our guiding star, and we followed in its wake. There is really only one bad corner on this the west side of Glencroe, but, unluckily for B., the car, the Triumph, and the Vindec all struck the turn about the same time. The

Vindec's low gear scored here, the Triumph being stuck on the bend, owing to there not being sufficient room for B. to rush the corner.

We took the Devil's Elbow down hill, and I should say that it will require a lot of getting round on a fixed geared machine. At the foot of Glenfinart, a beautiful stream of running water tempted us to halt, and B. gave me a fine aquatic exhibition before the "purr" of a fast approaching car caused him to hide behind a friendly boulder.

We had tea at a small cottage near Glencroe.

A quiet 8 m.p.h. down the bank of Loch Lomond to Luss finished up a day full of incident, and, as B. put it (or was it some other poet), "Something attempted, something done, *had* earned a night's repose."

We returned South, *via* Erskine Ferry, Paisley, Kilmarnock, Ayr, Cumnock, Sanquhar, Dumfries, Carlisle, Appleby, Brough, Sedburgh, Quornholme, Garstang, and Preston, missing the series of police traps that now stretch from Milnthorpe through Lancaster to Garstang.

The machines ran perfectly throughout the trip. The Triumph sustained a nasty gash in the back tyre, but beyond two punctures B. had no further trouble. The Vindec was as reliable as usual, and I only had one stop to change a sooted plug, due to over lubrication. The machine has now done over 12,000 miles, and the way the engine still pulls is really remarkable. Speaking for myself, I am prepared to climb Glenfinart at any time, without pedal assistance, but any rider on a single-geared machine must be prepared to take risks at the corners on account of the vile surface. The last turn is considerably worse than the famous Sutton Bank corner, as the gradient is 1 in 5 or 6 all the way round.

I understand that we are the first motor cyclists to climb Glenfinart, so I am now looking round for two cheap medals and——, but I do not want this to reach the ears of B.

HUGH GIBSON.

**VIEWS OF GLENFINART.**

(1) The lower reaches, showing the road winding upwards to the left of the pine trees.

(2) One of the many awkward turns. After rounding the corner the gradient is 1 in 4 for 250 to 300 yards.

(3) Showing the steep and winding nature of the road.

CURRENT CHAT

Special Features

Motor Cycles for Patrolling.

Motor cyclists are now assisting in the excellent road patrolling arrangements of the A.A. Motor cyclists are advised to carry the machine badge crossways on the front guard extension.

A Record Entry List.

The entry for the Coventry M.C. open hill-climbing competition for motor cycles at Newnham on Saturday last was a record, the number of entries totalling 94. Moreover, one or two had to be refused owing to their late arrival.

The T.T. Motor Cycle Race.

The Tourist Trophy Race for motor cycles is fixed to take place in the Isle of Man towards the end of next month, probably the 22nd inst. Entries close on the 1st prox. Up to the present eleven entries have been received.

Saturday's Race Meeting at the Stadium.

The annual race meeting of the Auto Cycle Union will be held on Saturday next, the 22nd inst., at the Stadium, Shepherd's Bush. There should be a large attendance, as all the well-known racing men have entered for the various events.

Motor Cycle Hill-climb at Trouville.

Our French contemporary *Les Sports* is organising a hill-climb for August 26th at the well-known French seaside resort Trouville. The Herdtle, Bruneau, and Albatross motor cycles have already entered. The hill is known as the Côte du Calvaire.

A.C.U. Permits.

Permits have been granted for the following events: August 22nd, three miles motor cycle handicap, 76 by 76 class, Worthing Excelsior C.C. Sports. Hon. secretary, V. Cowan, 22, St. Dunstan's Road, West Worthing. August 26th, three miles motor cycle handicap, 76 by 76 class, Uxbridge C.C. Sports. Hon. secretary, W. H. Gough, High Street, Uxbridge.

Imports of Motor Cycles.

162 motor cycles were imported last month (value £4,062) and £3,713 worth of parts, a decrease of £621 over July, 1907. Imports during the seven months ended 31st July were 1,070 motor cycles valued at £28,956, and parts value £15,026—a total of £43,982, as against £58,033 in the corresponding period of 1907, and £58,586 in 1906.

Exports of British Machines.

Eighty-five motor cycles were exported from this country during July (value £3,009) and £1,305 worth of parts. During the seven months ended 31st July 475 British made motor cycles have been exported of the value of £16,172, together with parts value £12,627—£28,799 in all.

New A.C.U. Badges.

The new badges, which are rapidly being sent out to all those who have ordered them, have been very greatly admired, and there is a big demand for them, both from the private members of the Union and from members of affiliated clubs.

Summonses on the End-to-end Run.

In our report of the End-to-end contest it was mentioned that Miss Hind and Mr. Sproston encountered a police trap at Penrith on the third day. The case came on recently, and Miss Hind was fined £2 and costs and Mr. Sproston £5 and costs. Both had their licenses endorsed.

Harry Tate Wins a Motor Cycle Race.

On Wednesday last at Herne Hill, the music hall sports meeting was held, and a motor cycle race was one of the items on the programme. Leonard Mortimer (scratch) rode a 1908 Triumph with mudguards and pedals, and conceded 200 yards start to Harry Tate (on C. R. Collier's famous Matchless racer) and T. Cowan (on Harry Martin's Matchless racer). There were two other competitors on roadster machines. Harry Tate caused much amusement by keeping the competitors on the starting line while he went round the track two or three times to warm his engine. The race was a good one, Leonard Mortimer making a very good struggle. Harry Tate won, T. Cowan finishing second—only a wheel in front of L. Mortimer. Mr. Straight was the handicapper.

S. G. Frost, who won the Jarrott Cup in the M.C.C. London to Land's End and Back Run, on August 3rd and 4th. He rode the same 4½ h.p. Twin Minerva, on which he won the M.C.C. Cup in the London-Edinburgh and Back Trial at Whitsuntide.

COVENTRY M.C. OPEN HILL-CLIMB.

HOW WE CLIMBED GLENFINART (Illustrated).

Police Traps.

A police trap was instituted on the 9th inst. on the main road between Lincoln and Newark, starting a little on the Newark side of the half-way house. It is about three miles in length.

Motor Cyclists' Meet at Stratford-on-Avon.

Motor cycle club secretaries should make a note that the great meet of motor cycle clubs at Stratford-on-Avon will be held on Saturday next, the 22nd inst. Mr. R. Vernon C. Brooks of the Birmingham M.C.C., has organised the meeting, and we understand that more than twelve clubs will take part.

Long Distance Runs Popular.

The popularity of long-distance riding on motor cycles is surprising. The A.C.U. twenty-four hours' ride was the second long run during the same week, yet the entry list totalled thirty-five, the entrants being chiefly amateurs. It proves at any rate the absolute reliance riders have on the machines, for a continuous run of twenty-four hours on hilly roads is undoubtedly a severe test.

Victim of Night Trap.

At Greenwich, Cecil E. Pinkerton of Blackheath, was summoned for driving a motor cycle at the "estimated speed of over 28 m.p.h." P. Battersby admitted that he was caught in the night trap at Eltham. Defendant, who denied the speed, was fined 40s. and costs. Since the signalling was by the extremely uncertain method of flashing a lamp, readers can draw their own deductions.

A.C.U. Penalty Run.

It has been decided that a penalty run, open to both members of the Union and associate members of affiliated clubs, shall be held next month. The route will probably be the same as in previous years, starting from Woodford, Essex, and finishing there. The entrance fee will be 3s. per member with a fine of 1s. for each stoppage, the maximum amount of the fines to be 5s. Bronze medals will be awarded competitors making non-stop runs and finishing within schedule time. A tea prize of two guineas is also to be awarded to the club whose member as a team accomplish the best performance. This event is always the most enjoyable sporting fixture, and is to be hoped that it will be well supported by all members and the affiliated clubs that can conveniently compete.

A Promising Motor Cycle Track Racer.

A rider who has been rather unfortunate this year on the racing path is A. Greenaway. He rode second in the scratch race at Aston, and was only prevented from finishing through his coil failing. At Cambridge he was only beaten by one length in the first race by Hodgkinson, and he made a very good race with Bennett in the scratch race. Such close running should encourage him to persevere, and shortly he will doubtless be able to place a first to his credit.

A Lucky Motor Cyclist.

Andrew Phillips, of Middlesbrough, was summoned last week for riding a motor bicycle at a speed dangerous to the public at Eaglescliffe on July 5th. Two constables stated that they timed defendant, who was towing two cyclists, one on either side, the speed being 23 m.p.h. There were a good many people about. Defendant denied travelling at more than eight or nine miles an hour, and called the two cyclists and a Middlesbrough fruiterer in support of his statement. Defendant's solicitor pointed out that not one of the thirty people said to be on the road had been called. The case was dismissed. Alderman Page said the Bench thought the evidence of the prosecution very unsatisfactory, to say no more. They had very strong evidence to say there was scarcely anybody about, and the police, they thought, should be careful as to what they said. Defendant's solicitor asked for costs, and the Bench, by a majority, decided to allow the application. Surely this constitutes a record!

International T.T. Prize Fund.

A special fund has been opened to provide good cash prizes for the winners, and to assist in defraying the cost of the race. Any contribution towards this fund will be much appreciated, and should be sent to the secretary, Auto Cycle Union, 18, Down Street, Piccadilly, W., as early as possible.

The T.T. Motor Cycle Race.

The Tourist Trophy Race for motor cycles will be held over the same course as last year, viz., St. John's, Ballacraine, Kirkmichael, Devil's Elbow, St. Germain's, Peel, and back to St.

John's. The following entries have been received: Mr. C. R. Collier, Matchless (holder single-cylinder class); Mr. H. Rem Fowler, Norton (holder twin-cylinder class); Triumph Cycle Co., three $3\frac{1}{2}$ h.p. Triumphs; Bat Motor Co., 6 h.p. Bat; Mr. W. H. Wells, 5 h.p. Vindec Special; Mr. R. W. Ellis, $3\frac{1}{2}$ h.p. Rex; Mr. W. H. Bashall, $3\frac{1}{2}$ h.p. Triumph; Mr. C. Gordon Gibson, $3\frac{1}{2}$ h.p. Triumph; and Mr. Noel E. Drury, 5 h.p. J.A.P.

Driving Licenses in Scotland.

The Midlothian County Council, in violation of the Motor Car Act, Sec. 3, Sub-sec. 3, has hitherto refused to issue licenses to drivers of motor cycles and motor cars extending beyond the 31st December in the year of issue, thus causing great inconvenience. Thanks to the efforts of a local official of the Cyclists' Touring Club, the County Clerk has now decided, after correspondence with the Secretary for Scotland, to issue, or renew, drivers' licenses for a period of twelve months from the date of issue or renewal, as is general elsewhere.

A.C.U. Race Meeting.

The annual race meeting of the Auto Cycle Union, which is to take place at the Stadium, Shepherd's Bush, W., on Saturday next, August 22nd, will provide some exciting racing, as all the well-known racing motor cyclists will be competing. Messrs. C. R. Collier, H. Martin, C. E. Bennett, H. V. Colver, W. W. Genn, T. A. Carter, and W. Hodgkinson will be fighting for supremacy in the one hour scratch race, which is always an attractive feature of this meeting. In addition to this race there will be a series of one mile time trials, a five miles handicap, and also a five miles handicap for standard touring machines. With such a programme as this there should be a large crowd of spectators at the Stadium to witness the sport.

Motor Union Notes.

The demand for the Motor Union motor cycle badge continues. Fourteen applications were received during the week ended August 8th. The following is an extract from a letter received from a London motor cyclist: "I must say I found the badge very useful during my run through the Peak district, and I must thank you for the prompt attention given to my application and the delivery of the badge." The Motor Union is constantly receiving letters similar to the following: "With regard to the badge, does the 6s. paid once cover the whole cost or is it a yearly charge?" The Motor Union charges one amount of 6s. only for the use of the motor cycle badge, and no further charge is made so long as the motor cyclist continues his membership with the Motor Union. If a member exhibiting the badge is charged for an offence of which he is innocent half his legal expenses are paid by the Union. Several clubs have decided to continue their joint affiliation to the A.C.U. and M.U.

FUTURE EVENTS.

- Aug. 21-22—Motor Cycle Union of Ireland Open 400 Miles Reliability Trials for the Muratti Trophy.
- " 22—A.C.U. Annual Race Meeting at the Stadium, Shepherd's Bush.
- " 22—General Inter-club Meet of Motor Cyclists at Stratford-on-Avon, organised by the Birmingham M.C.C.
- " 22—Worthing Excelsior C.C. Three Miles Motor Cycle Handicap.
- " 26—Uxbridge C.C. Three Miles Motor Cycle Handicap.
- " 29—Essex M.C. London to York and back, for members only.
- Sept. 1—Entries close for the Motor Cycle Tourist Trophy Race.
- " 12—Motor Cycling Club Petrol Consumption Tests.
- " 23—The International Auto Cycle Tourist Trophy Race in the Isle of Man.
- " —Penalty Run for Members of the A.C.U. and Clubs in the South of England Districts affiliated to it.
- Oct. 3—A.C.U. Council Meeting at Warwick.
- Nov. 20-28—Thirty-second Annual Stanley Show, at the Agricultural Hall, Islington.

C. W. Hathaway ($3\frac{1}{2}$ h.p. Triumph and Sidecar) making fastest time in the Passenger Class at the Coventry M.C. Hill-climb on Saturday last he was also second on formula.

Coventry M.C. Hill-climb at Newnham.

THE Coventry Motor Club is to be congratulated on having added another success to its list of open competitions. On Saturday last at Newnham, near Daventry, motor cyclists converged from all points of England to take part in the open motor cycle hill-climbing competition promoted by the above club. The entries were divided into six classes, and no less than ninety-four separate entries were received. This we believe to be a record entry for any motor cycle hill-climbing competition, closed or open, and such a complete entry must be particularly gratifying to the promoters. As early as 11 a.m. the weighing of the various machines and competitors commenced, under the superintendence of Messrs. H. Reynolds and R. Pugh. Mr. H. Reynolds had rigged

start. Soon after 3 p.m. the competitors in Class 1 commenced to ascend the hill, one minute intervals being allowed between each competitor, and ten minutes between each class to allow time for those entered in more than one class to descend the hill.

The hill is a severe one, and the course was about one kilometre in length, the steepest gradient being 1 in 6. It is a somewhat difficult hill to climb, owing to the fact that the gradient is in parts very deceptive. Soon after the start there is a cross road. Here the gradient is steep, although it does not appear to be so to a rider who is approaching it. This gradient necessitates a change down on all except the more powerful cars. Then comes a long stretch of slightly easier grade, followed by a bend near a barn which requires

The weighing-in at Messrs. Reynolds Bros.' Garage, Daventry. In the foreground is the interesting 3 h.p. Scott, fitted with a twin-cylinder two-stroke water-cooled engine. The machine is also provided with a two-speed gear and chain transmission. Mr. Scott won three first positions on formula in Classes 3, 4, and 6.

an excellent and accurate weighing machine in his yard at the Tudor Works, Daventry, and with Mr. Pugh's assistance the men and machines had all weighed in by 1 p.m. An adjournment was then made to the weighing platform at Daventry Station, where the passenger machines were duly weighed and passed.

Newnham village green is a pretty spot at any time, but on Saturday with the increased life and animation provided by the presence of visitors' cars and competitors' and visitors' motor cycles, it presented a picture that will be best realised after a glance at the illustration on the following page.

On the green numbered cards were placed at various points to indicate the positions to be occupied by the competitors when being marshalled prior to the actual start and to avoid confusion when those who rode in more than one class returned to the green for a fresh

some care. Soon afterwards the steeper portion commences, and there is no ease until the 1 in 6 section at the top is reached.

After this description it will not surprise readers to hear that some of the machines with small engines failed. J. P. le Grand usually makes very fast time in hill-climbing events, but Newnham proved too much for his 2½ h.p. Matchless, also for H. L. Cooper's 3 h.p. Triumph and F. E. Barker's 2¾ h.p. Rex.

The excellent performance of the first four riders in Class 2 (J. Marshall, W. F. Newsome, W. G. McMinnies, and E. S. Myers), who all rode 3½ h.p. T.T. Triumphs, was remarkable, there being a difference of only 6¼ s. between the first and fourth riders. Then came Brice on his Brown, followed by five more Triumph riders (J. H. Slaughter, E. L. Roberts, A. W. Bentley, Gordon Gibson, and T. W. Drayton)

Coventry M.C. Hill-climb at Newnham.—

Of these five, Bentley doubtless would have made far better time had he not been forced on to the grass at the cross roads near the foot by some of the spectators. Geoffrey Smith also suffered bad fortune; the petrol tap of his machine shook upwards on two occasions, and stopped the supply of petrol to the carburetter.

Considerable interest was taken in the fact that two old-time winners on motor cycles (Bert Yates and J. Wright) took part in this competition on new pattern Humber motor cycles, but their luck was not with them on Saturday. Class 3 was confined to twin-cylinder machines, and F. W. Applebee, jun. (5 h.p. Rex), scored a popular win on time, closely followed by W. H. Bashall (6 h.p. Bat-Jap), W. Heaton (5 h.p. Rex), and W. H. Wells (5 h.p. Vindec) in the order named. Then came Jack Scriven, F. White, and D. C. Godfrey, all on 5 h.p. Rex machines. The performances in this class were again remarkable for

some alterations made, which were not completed in time.

In Class 4, which was open to any motor bicycle, it was hardly expected that a single-cylindered machine would beat all the high powered twins, but so it proved; J. Marshall (3½ h.p. T.T. Triumph), who rode superbly, won on time by ⅓s. from F. W. Applebee, jun. (5 h.p. twin Rex), W. Heaton, Jack Scriven, and J. W. Wareing (all on 5 h.p. twin Rex machines) being third, fourth, and fifth. The next fastest single-cylinder performance was accomplished by Guy Lee Evans on a 3½ h.p. Rex, who sustained ill-luck in Class 2, the inlet valve cotter coming adrift.

It is interesting to note that in Class 5 three members of the Coventry M.C. were the only competitors who succeeded in climbing the hill with their passenger motor cycles. C. W. Hathaway (3½ h.p. Triumph, with sidecar and Nala two-speed gear)

A general view of the village green at Newnham, near Daventry, on the occasion of the Coventry Motor Club's Open Motor Cycle Hill-climb.

close running, 3⅔s. separating the first four competitors. Despite the horse-power, two riders failed to reach the summit (W. O. Bentley on a 5 h.p. Rex and E. Stubbs on a 3½ h.p. Rex). One of the Moto-Rêves ridden by W. Smith, although slowest of all, surmounted the hill without pedal assistance—a really marvellous feat considering the size of the engine and steepness and length of the gradient.

A. J. Sproston (5 h.p. Rex) was suffering from a cold all sustained in the morning while on the way to Daventry.

A. A. Scott on the Scott with twin-cylinder two-stroke water cooled engine caused a considerable amount of interest; his speed was not high, as he was last but one, but the ease with which the engine was started and the novel features embodied in the design of the machine attracted attention from enthusiasts in motor cycle construction.

Miss Muriel Hind (5 h.p. Rex) and T. H. Tessier (5 h.p. Bat-Jap) did not compete. Miss Hind, who drove her Deasy car from Dorset to Coventry on Friday last on purpose to compete, was disappointed at the delivery of her machine; she has been having

easily made fastest time, followed by H. Williamson (6 h.p. Rex Litette) and A. N. Startin (5 h.p. Riley tricar).

The variable gear class was fairly well supported, but not by any means representative. R. Lord, the winner, rode a 5 h.p. Rex with that firm's two-speed gear in the back hub; F. W. Barnes (3½ h.p. Zenette, Gradua gear) was second, and W. Newman (3½ h.p. Roc, Roc gear and clutch) third.

After a well-earned tea the officials met and worked out the placings, which will be found in table form on the next page.

The thanks of the club are due to Messrs. H. P. Boot, H. Hazlewood, W. E. James, R. Pugh, and H. Reynolds.

The judges were Messrs. V. A. Holroyd, John V. Pugh, and H. W. Staner. Clerks of the course, Messrs. B. H. Davies and H. W. Duret. Marshals, Messrs. J. K. Starley and E. W. Harris. Stewards, Messrs. J. F. Hug, C. Lloyd, A. Riley, J. W. Roebuck, and A. Wright. Timekeepers, Messrs. John Urry and C. Wheelwright. Trials hon. secretary, Mr. W. F. Grew (*The Motor Cycle*).

Coventry M.C. Hill-climb at Newnham.—

In the following table the fastest time in each class

is given as X in the first column, and the second column denotes the rider's position on A.C.U. formula.

CLASS I.

No.	Name of Driver and Machine.	On Time.	On Formula.
6	†Phil Baker (P) (2 $\frac{3}{4}$ h.p. Minerva)	x	1
7	W. Savage (P) (2 $\frac{3}{4}$ h.p. Garrard)	x+9 $\frac{1}{5}$	2
3	P. Smyth (2 $\frac{3}{4}$ h.p. Rex)	x+11 $\frac{3}{5}$	3

The other awards are a prize for fastest time in each class and a gold medal for best placing on A.C.U. formula in each class.

CLUB NEWS.

Sunderland and District M.C.C.

are holding a speed-judging contest this (Wednesday) evening, August 19th, over a course of about nine miles in length.

Leeds M.C.C.

The result of the two days' reliability trial for non-trade riders only, from Leeds to Bowness (Lake District) and back, has now been declared: 1st, T. G. Bullus (3 $\frac{1}{2}$ h.p. P. and M.); 2nd, W. Grinstead (5 h.p. Rex); 3rd, Frederick Bagshaw (5 h.p. Rex). The next event is the speed competition at Templenewsam, for the N.S.U. Shield and medals.

Essex M.C.

This club's 200 miles reliability trial, fixed for the 29th August, has been abandoned owing to the large number of long distance trials held this year, and also the fact that it is impossible to get a permit from the Royal Automobile Club for the Light Car class.

The London-York run will take place on the 29th August as the same had to be postponed on account of Newham Hill climb last Saturday; entries should be sent in immediately.

Entry forms are now issued and may be obtained upon application to Mr. Harold Fuller, Wynndale Road, Woodford, Essex, the hon. sec.

Scottish Motor Cycle Clubs Meet.

On August 8th the motor cycling clubs of Perth, Dundee, Edinburgh, Glasgow, and Falkirk held an inter-club meet at Stirling. A most enjoyable afternoon was spent.

Hull and East Riding A.C.C.

Nine competitors took part in the above club's 150 mile non-stop run on Thursday last. The results will be announced next week. On Saturday next a meet and hill-climbing competition will be held at Elsham (Lincs.)

Manchester M.C.

Five out of twenty-two entrants in the M.M.C. reliability trials, held on the 1st and 3rd inst., completed non-stop run for both the outward and the homeward journeys (350 miles). The winner of the Triumph cup, gold medal, and prize for hill-climb on formula was Otto Gross (4 $\frac{1}{2}$ h.p. Eagle Runabout). Special trade prize, value £5 5s., C. E. Kettle (3 $\frac{1}{2}$ h.p. Triumph). Special club gold medals for non-stop runs: H. Reed (4 h.p. Dot); J. Tytler (3 $\frac{1}{2}$ h.p. Triumph), tied for cup last year. W. Heaton (5 h.p. Rex); and C. E. Kettle (3 $\frac{1}{2}$ h.p. Triumph). Gold medals for 98% marks: H. Andrews, E. Broadhead, E. W. Buckley, J. L. Rose, and T. E. Leigh. Fastest time on hill-climb, A. J. Moorhouse (5 h.p. Rex), who wins special prize presented by Mr. Percy Butler.

London to Plymouth and Back in a Sidecar.

As my own entry for the A.C.U. twenty-four hours' run was sent in too late, and being unable to move the stony hearts of the Down Street officials, I was on the point of following the competitors unofficially on my trusty Rex, when Mr. Wright kindly found me a seat in the sidecar of the $\frac{1}{2}$ h.p. Phänomen.

This is the beginning of my story, and our adventures may prove interesting. At 9.12 p.m. on Friday night we started on our long run of 223 miles in the best of spirits, and very soon had checked at Guildford. After Guildford came the Hog's Back, which I have always considered a stiff morsel for a passenger machine, but to my surprise the Phänomen made light of the gradient. From there we purred along the up and down road through Farnham, Alton, Winchester, and Alresford, and soon after the latter place our luck deserted us, for we lost our way with a vengeance,

stretch we were misinformed of the distance from Crewkerne to Yeovil, and arrived there twenty minutes late. Again, just as we were leaving, Newman arrived, having been delayed by a puncture, but he was as determined as ever.

We Again Miss the Road.

Continuing our way to Salisbury, bad luck overtook us again, for we lost our way out of the town, every person we asked pointing out a different route. We found ourselves at last on Salisbury Plain. We were advised to turn off to the right and try to make Romsey, and after that the journey became for us a malignant nightmare. We lit up, but lost our way with mortifying persistence, and after rousing many irritable cottagers from their beds, succeeded in reaching Romsey at about midnight, tired, hungry, and numb from the bitter cold. About five miles from Rom-

Start of heat 2
of the event for
Tourist motor
bicycles at the
Essex M.C. meet-
ing at the
Stadium on
Saturday, the
8th inst.

avelling in some extraordinary way to within seven miles of Southampton, when the writer happened to notice the inscription on a milestone. Turning quickly, we made up for lost time as much as the corners would allow, and eventually checked at Salisbury, having lost nearly two and a quarter hours.

Making Up Lost Time.

Thereafter we purred rapidly along, and about eight miles out of Shaftesbury we came across the unlucky Leiger, who had run into a bridge in the dark and damaged the forepart of his machine very badly. As we could do nothing for him, we reluctantly continued our way to Yeovil, where we partook of breakfast. We managed to complete the timed stretch between Yeovil and Honiton within four seconds of schedule time, and I do not think I have ever seen such awful pads in a trial before, except the London to Land's End run. At Yeovil we found the unfortunate Newman with two teeth out of his timing gear, hard at work overtailing two more in.

We made light of the dreaded Yarcombe Hill on our new gear, and soon reached Plymouth. Just as we were leaving, Newman came in, tired and dusty, but jubilant notwithstanding, and left just before us. We journeyed from Plymouth to Honiton at a good pace, and then settled down for the timed stretch to Yeovil. In this

sey we could stand it no longer, and fell asleep by the roadside till 4.30 a.m. on Sunday. We awoke and started off immediately, and got going at a rapid pace, making Winchester, Alton, Farnham, and Guildford in quick succession, and arriving at Thames Ditton at 7 a.m. on Sunday. If we had not missed our way so much we should have gained at least a silver medal, as the machine and tyres were untouched from start to finish, bar shortening the belt. We heard a lot of grumbling about finding the way in the dark, and it is to be hoped that next year means will be found for ensuring a straight-through night journey.

The cheery purring of the Phänomen helped to keep our spirits up, and our failure to finish in time was all the more mortifying because of the complete absence of trouble.

On the whole, the competitors seemed to regard the run as more severe on machine, tyres, and riders than the London-Edinburgh run, and I am bound to agree with them.

A. G. FENN.

The Chief Constable of Lincolnshire has notified the Motor Union for the general information of motorists "that circumstances have made it imperative for increased police supervision of traffic on the Sleaford to Lincoln and the Lincoln to Newark high roads."

RECENT PATENTS.

By ERIC W. WALFORD, F.C.I.P.A.

A Danish Idea.

The front portion A and rear portion B of the frame are connected by a box-like structure C, which is adapted to contain the tanks and ignition mechanism.—J. C. Hansen-Ellehammer, No. 19,485, 1907.

A Combined Pulley and Belt Adjuster.

A carrier A is mounted upon the engine crankshaft and adapted to oscillate concentrically therewith, but eccentrically to the driven pulley. The carrier A has attached to it a sleeve upon which is mounted the belt pulley. The fixed flange B of the pulley has connected to it a chain wheel C by which it is driven from the engine. The loose flange D

is carried upon a bearing which can be acted upon by a spindle E working in a thread F to provide the lateral adjustment. This spindle extends through the carrier A and carries at its end a spur pinion G gearing with corresponding teeth on a segmental plate H. Between the segmental plate H and another fixed plate J is a movable segment K, which is provided with a row of teeth L, normally held in engagement with teeth on the segmental plate by springs M. Slidably mounted in the carrier is a locking piece N, which has two rows of teeth, O and P, and may be operated by a Bowden wire (not shown). The operation is as follows: When the locking piece N is moved to a position where both sets of teeth O and P are out of engagement, the carrier may be oscillated the required amount. As the segmental plate is held stationary by its engagement with the teeth L on the fixed plate, this oscillation rotates the pinion G and spindle E, moving the loose pulley flange through the action of the thread F. If the belt is not now at the right tension the locking piece N is moved to disengage the teeth L, and to engage its teeth P with those on the segmental plate. The carrier can now be oscillated to vary its distance from the driven pulley. As in this case the segmental plate moves with it the operation is accomplished without affecting the adjustment of the movable pulley flange D.—H. J. Rake, No. 15,166, 1907.

A Spring Saddle Support.

A pair of supporting bars A are pivoted to an adjustable clip B, which is secured to the frame member C. These bars carry the saddle D at their upper ends. The oscillation of the supports A about their pivots is restrained by a spiral spring E, and a laminated spring F adjustably secured to the back forks of the machine.—V. Rawson, No. 23,069, 1907.

A New Driving Belt.

This inventor boldly proposes that a flat steel belt be used covered with waterproof canvas and provided with metal studs. This is to run on belt pulleys and belt rims provided with rubber washers.—W. S. Ferguson, No. 11,438, 1907.

An Improved Chain Belt.

A driving chain A forms the core of the belt. This chain apparently is of an ordinary type, and on it is threaded a number of leather pads B. These taper to conform the belt pulley groove, and they also taper in the other direction, so that as shown in the drawing, the belt can take up a curve of quite a small radius and loss of power owing to bending is prevented. Special devices are mounted on the chain A to prevent slipping of the pads B.—J. J. Bergin, No. 1,329, 1907.

A Variable and Free Engine Pulley.

Secured to the engine-shaft A is a boss B, which carries on feathers C the sliding pulley flanges D D. Each pulley flange at its outer side is provided with an anti-friction ball race E, the balls being retained by a second disc F mounted on the outer side of each flange. The discs F do not rotate with the pulley flanges, but are adapted to rotate to a limited extent on the boss B, being provided with arms G, connected by a pin H, to which is secured the operating rod J. The outer face of each disc F is provided with one or more inclines K co-operating with corresponding inclined planes L on collars M and N, the one secured to the engine crank case, and the other carried rigidly by arms P projecting therefrom. Thus, when the operating rod is moved the inclined planes co-act to move the sliding pulley flanges simultaneously inwards and outwards on the boss B. When the pulley flanges are at their greatest distance apart, the driving belt comes down upon the boss B and a free engine is provided.—C. Haigh, No. 15,276, 1907.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.

York and Lancashire.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex

SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

SECTION X.

Scotland.

SECTION XI.

Ireland and Isle of Man.

PREMIER MOTOR AGENCY,

Aston Road, BIRMINGHAM.

Telephone: 4310. Telegrams: "Primus," B'ham.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes will be sent for forwarding replies. Only the number appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' entry"; or if "London" is added to the address, to the number given, c/o "The Motor Cycle," Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties advised of this receipt, and upon intimation of arrival and acceptance of the goods, the money forwarded less a charge of 1s. for registration. Time allowed for a decision after receipt of the goods three days. For all transactions exceeding £1 value, a deposit fee of 2s. 6d. is charged. All matters are dealt with at Coventry, and cheques and money orders should be made payable to Little Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive answer to their enquiries are requested to regard silence as an indication that the goods advertised already been disposed of. Advertisers often receive many enquiries that it is quite impossible to reply each one by post.

All letters relating to advertisements must be distinctly under what heading they appeared, and of issue.

Accumulators

UNSPILLABLE 1908 TYPE.

Read what a private rider says (*Motor Cycle*, July 15th, '08, letter No. 3414) when answering a letter from another reader of the *Motor Cycle*, who does not use "E.P.R." accumulators.

"If your correspondent will try 'a couple of 'E.P.R.' unspillable accumulators, I think his troubles 'will be at an end. If he cares to 'do so, he can put them in his 'tank upside down, but he will get 'no acid trouble. Unlike most of 'the unspillable type, they contain 'no jelly. I have had two in use 'for some considerable time, and 'find them excellent."

No. 20c. 4 x 2½ x 6in. "Acid type," 14/6.

No. 20c /08. 4 x 2½ x 6in. "Un-spillable," 17/6.

We make these unspillable accumulators in all sizes from 5 to 50 amp. capacity. All unspillable types are sent out fully charged and ready for use. No loose acid to shake out. Full instructions with every cell. All batteries, whether usual type or unspillable, fitted with "E.P.R." non-corrosive terminals.

A FEW SIZES ARE LISTED HERE.

		"Acid type."	"Un-spill."
The "Fleet"	4 volt 5 amp.	6/6	7/6
	3½ x 1 x 4½		
No. 19c	3½ x 2 x 6	10/6	13/6
" 16r	3½ x 2½ x 5½	13/6	16/-
" 20c	4 x 2½ x 6	14/6	17/6
" 30c	3½ x 2½ x 6	18/6	21/-
" 40c	4½ x 4½ x 6½	25/-	28/6

REPAIRS.—We make a speciality of treating old and damaged batteries. We can either repair and make them equal to new, or else allow their value in part exchange for new "E.P.R." cells. Send for new catalogue and terms.

NOTE.—All repair work guaranteed. Minerva accumulators cannot be repaired.

6 h.p. Rover, late 1907, special body, Cape hood, Lucas lamps; cost £175, would sell for £100, or accept a second-hand 1907 Triumph and £70 cash.—Motorist, Strathmore, Wellington Road, Worcester Park.

10 h.p. Armadale, Stevens engine, two-cylinder, three speeds and reverse, wheel steering and control, side levers, door to driver's bucket seat; £65, or lower power and cash, or small car.—Cartington, Slough.

8-10 h.p. Four-cylinder Humber, one of the best, swing seat side entrance, Cape hood, folding glass screen, electric side lamps, gas headlights, everything in A Won order; £140, bargain.—28, Woodbridge Road, Ipswich.

LOTTORETTE, genuine 6 h.p. De Dion engine, two bucket seats, sloping back, three speeds and reverse, complete with all lamps, tools, guaranteed good order throughout; bargain, £55; letters only.—Jones, 260, Dalston Lane, London.

FINE Opportunity.—Pope Tribune, side entrance, 14 h.p., splendid hill-climber, seats four or five, showroom soiled only; cash, exchange tricar or cycle, or extended payments arranged; also new chassis same make.—The Service Co., 292, High Holborn.

31 h.p. Auto Phaeton (bike and two-wheel sidecar), Fafnir engine, H.T. magneto, two-speed gear, 2 1/2 by 26 new Continental tyres, coach-built body, enamelled green, gold lines, splendid passenger turn-out, good as new; £28 10s.—128, High Road, Tottenham.

LIGHT Two-seated Voiturette, 6 h.p. Aster engine, just been rebored and fitted with new piston and rings, repainted and lined, two new tyres on back, two speeds; bargain, £40, or exchange motor cycle and cash, or two motor cycles.—Hucke, Bowyer Road, Birmingham.

BENZ. — Exceptional opportunity. A grand little 4 1/2 h.p. belt-driven Victoria, with hood, three speeds, including Crypto, solid tyres, car is in practically new condition, having been used only at intervals, very reliable and economical; cash wanted, £12 10s.—54, Croham Road, Croydon.

ROVER Cars. — The 6 h.p. single-cylinder two-seated Rover is the best low-priced car on the market. It is fast, silent, exceptionally reliable, and far more comfortable to ride and drive than tricars or motor cycles. We will take these in part exchange, or supply on deferred payments. — Louis Davis and Son, Moseley, Birmingham.

6 h.p. Peugeot Miniature Racer, low, bucket seats, circular tank behind, raked steering, wire wheels, very fast, nearly everywhere on top, 45 to gallon, condition equal to new, two headlights, and brass Salisbury oil lamp, also electric tail, spare tyre, two tubes, tools, etc.; trial given; £90; consider good motor cycle or tricar part payment.—Lamonby, Longford, Uddingston.

9 h.p. Riley, two-seater, in perfect running order, accumulator ignition, Cape cart hood, underscreen and inside mudguard, extension to all wheels, large head lamp and horn, 700 by 90 grooved Dunlop, one outer two inner spare tyres, Imperial odometer (trip), double radiator, tools; trial and any examination allowed; price £130; no offers.—Apply, Box L3,027, The Motor Cycle Offices, 20, Tudor Street, E.C.

WE NEVER KNEW

how thoroughly unsatisfactory the ordinary Acetylene lamp had proved until we began to offer to take them in exchange for THE PREMIER SEARCHLIGHT.

We have been inundated with lamps—many of them practically new—whose owners have realised that there is nothing like the Premier. The offer is still open. Send your old lamp, labelled with your name and address, and we will quite a liberal allowance. Not one of our quotations has been declined yet. Price of Searchlight only, 24/-, or with Generator, as illustrated, 30/-.

WE NEVER KNEW

how thoroughly unsatisfactory the ordinary Acetylene lamp had proved until we began to offer to take them in exchange for **THE PREMIER SEARCHLIGHT.**

We have been inundated with lamps—many of them practically new—whose owners have realised that there is nothing like the Premier. The offer is still open. Send your old lamp, labelled with your name and address, and we will quote a liberal allowance. Not one of our quotations has been declined yet. Price of Searchlight only, 24/-, or with Generator, as illustrated, 30/-.

The Motor Cycle Tourist Trophy Race.

THE next great motor cycle event of the year will be the holding of the Tourist Trophy Race in the Isle of Man, the definite date for which is now officially announced as being September 22nd. Last year this, the first road race for motor cycles held in the British Isles, was a splendid success. It was a really sporting event, and it left its good effect on the later models of more than one make of machine. Those who entered for the competition also learnt a valuable lesson; they had no idea how economically a powerful motor bicycle could be run without seriously affecting its efficiency, with the result that some of those who last year complained that the petrol allowance was insufficient, demanded this year that the amount of fuel should be reduced. Now that the conditions have been rendered somewhat more difficult the race should be even more exciting, and there should be no great amount of fuel left in the tanks as was the case with more than one machine last year. The riders must bear in mind that the race is not a consumption test, and consequently the more petrol there is left the greater is the evidence of the misjudgment of the driver. The point to be aimed at is that the greatest possible speed is to be maintained and the least possible amount of fuel is to be left over. As the greatest speed possible with the amount of petrol allowed is the main factor of the competition, the latter's importance cannot be over-estimated. English riders have so few chances of travelling at a great pace under official observation for any length of time that

they hardly know what will happen under these conditions. Rattling round that course lap after lap at double legal speed, taking corners as fast as possible, climbing steep hills, and making up time on the level, all tend to find out the weak points of a machine, which would hardly be evident on a twenty miles an hour journey from Land's End to John-o'-Groat's. Hence leaving out the sporting side of the race, its utility cannot be denied.

The T.T. Prize Fund.

UP to the time of writing eleven entries have been received, while nine more are required to attain the requisite number, since unless twenty entries are received no race will be run. The competition is somewhat costly to organise and run, but to encourage motor cyclists and the industry to enter the prizes will be made worth winning. It is hardly surprising, therefore, to learn that the A.C.U. is instituting a special prize fund, to which it invites motor cyclists and motor car owners interested in motor cycling to subscribe. This fund deserves the heartiest support, and we sincerely hope that all who have the interests of the movement at heart will contribute. The shillings of the poor and the guineas of the rich are equally appreciated in matters of this kind, and we therefore appeal to all who can afford it to help render the race a real success by sending a small donation to Mr. F. Straight, secretary of the Auto Cycle Union, 18, Down Street, Piccadilly, W. Further particulars regarding the fund, and a list of the donors, will be found on the Current Chat pages.

Standard Machines in Hill-climbs.

By B. H. DAVIES.

DESIRE to take strong exception to some recent remarks by your contributor, "Ixion," about the absence of special machines from hill-climbs. I fancy he is not in the habit of regularly attending such functions, and while it was the exception to many special machines competing up to a short time ago, competition has now become so keen, and hill-climbing reputation so valuable an asset commercially, that several firms leave no stone unturned to sweep the boards. This abuse has always cropped up spasmodically. I was once an innocent culprit myself. My own machine needed a few repairs, and I took it to the makers with a request that it should be ready by the date of an approaching hill-climb. They replied that they could not get it ready, but that they would lend me one of their trial machines. They did so, and I rode it without discovering that it weighed 100 lbs. lighter than my own, and had about twice as much compression. (I am glad to say I failed to get any prize in spite of it.) That was years ago, and things have since improved, the trade riders using in most instances strictly standard machines, admirably tuned. For instance, at Fernhurst in 1905 I failed to coax my J.A.P. Triumph up the hill, and when Ayton and Albert went up fast, they were accused of not using standard machines. Mr. Ayton promptly seized mine and drove it up quite as fast as he had previously depended on his own. This state of things continued for a time. Gradually competition among the various manufacturers grew keener and keener; each firm tried to catch an advantage by engaging lightweight jockeys. Then the day came when every firm had got a 9 st. or 10 st. expert at its disposal. Then the mischief began. One or two firms started manufacturing special engines and machines, and at last an evil era has dawned, in which practically every trade rider rides a machine incorporating vital departures from standard specifications, and in some cases amateur riders favoured by the trade are also supplied with the special engine or the special frame.

The Newnham Entries.

I was a clerk of the course at Newnham on August 1st, and I doubt if a single standard machine figured in the time results of any one class, excepting possibly that for variable gears. I saw there special machines, special tanks, special carburetters, special silencers, and special engines. There is no very great objection, I think, to a man fitting fakes to his carburetter. It is a matter of brains and a few pence, not facilities that only a factory can supply, and which would cost an amateur pounds to duplicate; and so I should take no exception to a variable jet and two or three clever little float attachments, such as I observed on one machine that figured fairly prominently, even though these fakements are not supplied to the average amateur. But here is an anecdote which will illustrate my main point. A maker was considering ball bearings for his 1909 engine. He went to a firm who make a speciality of ball bearings, and was shown various samples. "Messrs. So-and-so," quoth the tradesman, "have used these for two years, and find them absolutely satisfactory." I may add that Messrs. So-and-so sell a machine

with plain bearings, but that they win many hill-climbs. Or, again, every now and then we have seen hill-climbs won any time this last five years by a small engine that obviously had a racing and not a touring compression; at Newnham on August 15th the majority of the prominent machines had a far bigger ratio of compression than any standard tourist machine I ever owned. I noticed other points, about which I can only speak with less certainty, but the variation in the silencers was obvious to duffers and ladies. One or two machines ridden by private owners ascended the hill almost inaudibly; nominally identical machines in the hands of racing amateurs and trade riders had practically open exhausts.

Face to Face with Two Alternatives.

I am not competing in hill climbs this season, chiefly through pressure of work, but if I could get away on Saturdays, I should probably refrain. Why? Because in the past it was possible for me to beat the maker of my own machine, himself mounted on a sister machine,

The first illustration of a 1908 T.T. racer. Mr. C. B. Franklin has entered this machine for the Tourist Trophy Race. The engine is a J.A.P. 85 x 85 with J.A.P. carburetter and magneto ignition. It weighs 160 lbs.

and I have actually done it. To-day I am face to face with two alternatives. Either I can enter for the climb on one of these special machines which as a privileged amateur I could probably obtain, and thus retain a chance of winning, and at any rate have the consolation of knowing I am beaten by a man who can get more out of the same engine and machine than I can; or else I must pay my 5s. or my 10s. for the privilege of crawling up the hill with a tailed off bunch of other amateurs amid the semi-derisive silence of the onlookers, and see myself beaten by machines having double as high a compression as my own, and so flimsily constructed that they are seldom used on the road except for climbs and special events. I refuse to adopt either alternative, and therefore I do not compete. Hundreds of other amateurs think as I do in the matter, and act similarly.

The Trade as a Whole are Guiltless.

I want to make it clear that we are neither to blame the trade as a whole, nor still less the trade rider, for this corruption of sport. The trade stuck to the standard machine until their hands were forced by one or two specially wideawake firms. I daresay the one or two firms who after holding their own for two years

Standard Machines in Hill-climbs.—

have been driven out of most prize lists in 1908, are planning special machines for 1909, and I cannot blame them. Still less do I desire to cast a slur on the trade rider. The trade riders ask nothing better than a fair

[Phil Baker (2½ h.p. Minerva with Chater-Lea frame). This local rider was first on time and on formula in Class I. at Newnham on the 15th inst.

field and no favour; I daresay they would jump at the idea of a climb in which 70 men rode identical machines of one make, just to see who was the best man; and after such a magnificent performance as that put up by Marshall in beating all the big twins on the 15th, it is obvious that if we amateurs were given the best special machines, we should almost always get licked just the same. The point is that at present if I buy a standard machine, I have no earthly chance of making a decent show—at least ten men will beat me; if I could or did buy a machine such as the trade rider bestrides, I should have a chance, and could only be beaten by the margin between my brains and experience, and their

brains and experience, instead of by the added margin between their machine and mine. But there should be no necessity for me to buy a special machine for competition; it is the special machine which should be confined to a special class.

Nothing is being Done.

Nothing is being done by club officials because the trade entries are necessary alike for the prestige and the financial success of every hill climb. But official silence on the point is deluding the uninstructed amateur into thinking he is beaten on his merits, instead of on the merits of his machine. To put it nastily, he is being cheated into thinking he has an equal chance.

What Can be Done?

It is further extremely difficult to say what can be done. To distinguish between trade rider, makers amateur, and pure amateur would puzzle a Solon when reduced from theory to practice. Members' classes supplementing a championship class will not do, as the trade rider is deservedly a welcome member of any sporting club. Novice classes will not solve the difficulty either, as an unscrupulous firm can easily find an unscrupulous novice and lend him a special machine. I can only suggest one alternative.

Disqualifying Engineers.

That is the employment of disqualifying engineers. This would first of all require two or three uncommonly good men, and secondly, a far more complicated entry form. The A.C.U. would have to procure information about the most secret details of every machine, and the winning machines would have to be dismantled, for testing the type of bearing, the ratio of compression, and so forth. I doubt if we can find two or three men who will make themselves absolutely conversant with every detail of every machine, and test the winner for its adherence to standard. A very superficial acquaintance with modern motor cycles would have sufficed to disqualify about half the entrants at Newnham, but increased official vigilance would bring increased competing ingenuity.

Scenes at the Coventry M.C. Hill Climbing Competition at Newnham, near Daventry, on the 15th inst. On the left, W. H. Wells, 5 h.p. T.T. twin Vindex, who was fourth in Class 3 on time and third on formula. On the right, W. G. McMinnies, 3½ h.p. T.T. Triumph; he was third in Class 3 on time and fifth on formula, and won the Silver Rose Bowl presented by *The Motor Cycle* for the best combined performance on time and on formula by a private owner.

THE BROWN MOTOR BICYCLE.

WE have lately had under test a $3\frac{1}{2}$ h.p. Brown motor bicycle fitted with high-tension Bosch magneto ignition and spring forks, which from the point of reliability and speed has proved all that could be desired. The engine was exceptionally clean running—that is to say, it did not dribble oil in all directions—and had plenty of 'heart,' but was handicapped by too high a gear, which was in the neighbourhood of $3\frac{3}{8}$ to 1. The consequence was that the machine required careful handling in traffic to keep the engine going.

The machine as a whole was well made and substantial without being unwieldy, but lacked a number of refinements which would go far towards making it an ideal mount. Handle-bar control, for instance, would give much smoother running, as the coarse cut quadrants and levers were very difficult to position when driving over bad roads, especially as one notch on either the ignition or throttle quadrant made all the difference between the engine racing away or stopping altogether. This was particularly noticeable on severe hills up which the machine required to be nursed. On the level the machine was quite fast enough for all ordinary requirements, and was very steady at high speeds, holding the road well without any bouncing. With regard to reliability, the only attention required in some 500 miles running was the detaching of the magneto transmission cover for the purpose of filling up with grease (after this attention

the machine ran a great deal quieter), the cleaning of the carburetter pipe, which had become choked, and the shortening of the exhaust valve lifter wire. This must be considered a good performance in view of the fact that the machine was brand new when we received it, and admittedly had not been tuned up by the makers. Being a new engine and having been

The latest Brown motor bicycle. This machine is fitted with an engine 82×90 mm., and gear-driven magneto ignition.

copiously lubricated, it was given a paraffin bath after about the 400th mile, and then charged with fresh, clean oil, with consequent marked improvement in the running. In conclusion, we found the Brown fairly economical with petrol for her size, and an easy running machine.

Important German Consumption Trial.

THE motor cycle contest, entitled "Round Berlin," organised by the German Cycling Federation last week, was not a race but a fuel consumption trial, awards being based on the weight propelled divided by the quantity of liquid fuel (petrol or benzol) consumed. The course, as the title indicates,

W. Thiede, 3 h.p. Goricke. Note the curious headgear.

was a circuitous one of about $144\frac{1}{2}$ miles in the neighbourhood of Berlin, starting and finishing near Potsdam. Thirty tricars and motor bicycles took part, divided into three classes—Class I. tricars, Class II. motor cycles over 2 h.p., and Class III. motor cycles under 2 h.p. Among the different makes which competed were F.N., Phänomobil, Magnet, Göricke, Durkopp, Laurin and Klement, N.S.U., Wanderer, Progress, Brennabor, Phänomen, and Motosacoche.

The winner of Class I (tricars) was the driver of a F.N. with forecarriage. He occupied 9h. 11m., the total weight carried was $288\frac{1}{4}$ kilogrammes, and the consumption 8 litres.

Class II. was won by W. Thiede on a 3 h.p. Göricke. Time occupied, 8h. 51m.; total weight carried, 198 kilogrammes; consumption, 5.9 litres. In the same class the highest consumption was $12\frac{1}{2}$ litres; time, 6h. 53m.; total weight, 162 kilogrammes. This competitor, who rode a Magnet, evidently was only out for speed, as he made the fastest time and consumed more spirit than anyone else, with the exception of one of the tricar entrants, whose petrol bill was 19 litres.

Class III.—With the exception of one F.N. and one privately built machine, Class III. was represented by five Motosacoche machines, one of them winning, and the others occupying third, fourth, fifth, and sixth positions. The winner's time was 9h. 21m., consumption $3\frac{3}{4}$ litres, weight 124 kilogrammes. This is equal to a total weight of 2 cwt. 2 qrs. 20 lbs. propelled $144\frac{1}{2}$ miles, with a consumption of $6\frac{3}{4}$ pints.

Questions & Replies.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied with a stamped addressed envelope for reply.

Filings between the Platina.

?

I have ridden my $3\frac{1}{2}$ h.p. machine (which is fitted with a Bosch magneto) about 1,600 miles. I noticed that the platina were beginning to pit, so I placed a fine file between the two points to clean them, afterwards wiping the contact breaker with a rag. On replacing the cover the engine refused to fire at all, and on testing the magneto with the little spanner there was no spark. I again looked at the contacts—there was nothing amiss, but I inserted a piece of a visiting card between the points, and the engine afterwards fired perfectly. Can you suggest a reason for the engine refusing to fire at first?—W.D.F.

It is highly probable that some portions of dirt or filings remained between the platina, and thus prevented them from making a good contact. When you used a piece of card the foreign particles were probably removed and a proper contact was again made. After filing the points it is always best to use a rag or brush soaked in petrol to thoroughly clean the contact breaker.

Increasing the Air Supply.

?

My 6 h.p. Riley tricar is fitted with a B19 Longuemare carburetter. This does not supply enough air, especially when running on the magneto. With the throttle lever set half open I have to put the air lever to fully open. I am using a 20 mm. choke tube. This means that I cannot get full power out of the engine. I have fitted a Bowden extra air inlet on the induction pipe, and find this to a certain extent an improvement, but if I give a little too much air I have to close down the extra air and begin again to find the mixture. With our hilly roads and constantly varying gradients this is an impossible state of things. What would you suggest? Can I fit another pattern of carburetter? It would require to be operated in the same way as my present one, as I do not care to have new levers and fittings.—CEYLON.

You can increase the air supply by fitting the next size larger choke tube. Three sizes are or should be supplied with every Longuemare carburetter. If you have the largest one fitted already, try a smaller sized spray, which will have almost the same effect as increasing the air.

Buying a Tricar

?

I have taken in *The Motor Cycle* for some time, and owing to reading it I have become desirous of buying a tricar should the answers to my queries, which I shall be obliged if you will answer, prove satisfactory. (1.) Are they really reliable? (2.) What h.p. would you advise for touring purposes? (3.) What mileage to the gallon ought one to get out of them? (4.) How many speeds would be advisable, and should they be fitted with reverse?—F. B. F.

(1.) Perfectly reliable. (2.) Depends on weight to be carried and district in which you propose touring. Also type of machine you fancy. If you want a machine with bucket seats back and front, coach built, and with water-cooled engine, we should not advise less than 5 to 6 h.p., either single or twin. Properly geared and properly driven they give excellent results. (3.) This type of machine will run about sixty miles to the gallon with careful handling. (4.) Legally it should be fitted with a reverse if it weighs over 3 cwt. in weight, but this is not necessary otherwise.

Grinding-in Needle Valve Alters Petrol Level.

?

The carburetter of my $1\frac{1}{2}$ h.p. F.N. having lately taken to flooding, I examined the needle and found it to have a ridge near the point. I therefore pared it down with emery paper until the shoulder was quite gone and then ground it in, but it floods worse than ever now, and in addition has a tendency to misfire at the beginning of a hill, and is not such a good starter as it was. I find that when the petrol is welling out of the float chamber the needle is still not bedded down in its seating. Would it be a good thing to lighten the float, or should I upset the level of the petrol by this? If I don't do that I suppose a new needle is the only thing to cure it.—H.H., Hants.

In paring down the shoulder and then grinding in the needle, you have shortened the distance between the needle valve point and the weight. Consequently the petrol is shut off later now than formerly, and the level is higher. You can remedy matters and stop the flooding by raising the weight on the needle slightly, or if you will fit a small light washer over the counter weight on the needle it might

stop the flooding. In other words, the counterweight on the needle itself should be slightly weighted in order to cut off the petrol earlier.

Engine Knocking.

?

My engine knocks slightly after I have run a mile or two and I am at a loss to account for it. The machine is a 190 pattern, and has run 400 miles since the cylinder was removed, so the noise I suppose cannot be due to carbon deposits. I have a magneto fitted and two-speed gear with chain drive. The engine does not overheat and stop, and everything is quite satisfactory excepting the noise referred to. I live in a very hilly district.—H.W.D.

We suggest two things likely to be causing the knocking in your engine. Either the gear is too high for your weight or the magneto is timed too fast. Check the timing yourself and consult the makers of your machine with regard to the gear. You, of course, know that an engine will knock if the air lever is too far open.

Removing and Replacing the Cylinder.

?

My 3 h.p. Fafnir engine having taken to knocking badly when the spark advanced, and also of failing on hills which it used to climb

I have been wondering whether could remedy the fault by scraping the inside of the cylinder, but being a novice I would deem it a favour you would let me know whether it is a difficult job to replace the cylinder after it has been taken off?—J.W.F. Mon.

Yes, if you clean out the cylinder head and piston most probably the knocking will cease. It is not a very difficult matter to remove and replace the cylinder, but perhaps it would be better to get an experienced friend to assist you on the first occasion. If you have need to remove the piston rings be careful to insert a thin piece of whalebone or tin between the ring and the cylinder. You had better slip three pieces in at regular intervals when the ring will slip over. Great care must be taken not to break the rings. By this means you can clean any carbon deposits out of the grooves. The deposit must be scraped off with an old screwdriver or a mallet may be used if the deposit is very hard set. Tap the screwdriver gently to avoid damaging the piston.

OCCASIONAL COMMENTS.

By "IXION."

An American Motor Cycling Function.

An American motor cycling paper reached me by last mail, and apparently our Yankee confrères are rather sprightly when they let themselves go. Their official organisation has been holding what it calls a "bing bang fest," in process of which they passed through a dark, low tunnel, on emerging from which each member received a hearty smack from a harlequin's wand containing a blank cartridge, which caused damage to trousers in some instances. The next excitement consisted of stepping on a metal plate coupled up to an ignition coil, which dealt out some juicy shocks. At the conclusion of the proceedings one individual was discovered trying to find his way to bed armed with head and tail lights and a road map, while another was discharging a revolver until 3 a.m., when his supply of blank cartridges mercifully expired. It would be amusing to see the staid officials of our own A.C.U. indulging in such antics. Motor cycling is altogether a livelier affair in the States than here. They have been holding track races on a spot known as the Clifton Saucer—a wooden track of *six* laps to the mile, on which one intrepid rider covered a flying mile in fifty-four seconds!

Elimination in Motor Cycle Trials.

Several long-distance motor cycle trials have been utterly spoilt from a pleasurable point of view by the methods adopted to find an absolute winner. A case in point is furnished by the Schulte Cup competition. It may be a great testimony to the reliability of a machine for it to travel eight hundred miles, and as near as can be ascertained to cover twenty miles, neither more nor less, in every separate hour. But it is simply a monotonous grind for the rider, while the absence of milestones over portions of the route, and the fact that about two hundred miles out of the total are ridden in darkness, import a considerable element of luck. A better scheme for finding an out-and-out winner was included in the regulations for a recent long-distance event, which was not burdened with too many controls, but included a thirty-mile stretch, over which only three minutes of variation in time was allowed—a plan that permitted the major portion of the run to be done in go-as-you-please fashion. Even this scheme has its drawbacks. It is quite possible for a dozen men to emerge from it with records equally meritorious. An element of unfairness is also permitted to find entrance, since the man who knows the road best obviously has the better chance of doing his thirty miles dead to time. It has been suggested to me that such trials should be run much as they were formerly in the days when no absolute winner was required, and that the chief award should go to the man completing the distance with a clean sheet, and with his machine in the best condition. For instance, had this eliminating dodge been applied to the End-to-end, supposing some enthusiast had offered a valuable trophy for the best performance, elimination would have been limited to some half a dozen machines, thanks to the copious notes taken by the travelling marshals. If these six machines had been mustered before the judges and thoroughly overhauled, it would have been quite a simple matter to ascertain which machine was in the best condition. A few points to be taken into account

would be: Cleanliness from external oil; cleanliness of plugs; fit of valve faces; brake efficiency; loose nuts and bearings; leaky taps; compression; state of magneto, etc. Thus there would be entire certainty of giving the premier award to the machine which had really earned it, the conditions would not take horsepower into account, there would be no loophole for luck, and, above all, the run would not be injured from the point of view of pleasure, and the riders would not be continually haunted by niggling considerations of time and milestones and secret checks. I should especially like to see these conditions tested next year in one of the long distance events.

Lightweights in Trials.

The lightweight undoubtedly has so great a future that I may perhaps be permitted to state what the motor cycling public will demand from the manufacturers before they invest in such numbers that a "boom" can begin. They will want to see the lightweights they are going to buy come through the A.C.U. Trials practically without loss of marks. They will want to see not a single isolated machine of each make successful, but a whole fleet. Witness the history of the Triumph machine. I can remember when only a handful of *cognoscenti* were riding this make, and now the roads are thick with them. Their boom dates from the time when a small fleet of them began to go through every trial with the regularity of clockwork. Had but one Triumph competed in each trial, they would not have sold more than one machine for every fifty they are selling to-day. And, above all, the public want to know the weights of the men who ride these machines in trials. I, of course, am in a position to know that one or two of the trade lightweight riders are men I should be very loth to take on at catch-as-catch-can, and yet I am no chicken. I also know that one or two of them are bantam weight midgets. The public believe that all of them are pigmies, and since the average motor cyclist weighs at least eleven stones, he hesitates to seriously consider the lightweight. I think it rather negligent of the A.C.U. not to have given real prominence to the personal weight of the lightweight riders in the End-to-end, as some of the hill-climbing done by these machines was really remarkable, and will not be fully credited to them unless weights are published. Is it too late for Mr. Straight to send these to the Editor for publication? Many riders saw these machines on various bad hills, but it is impossible to guess a man's weight when he flies past you dressed in a loose flapping suit of overalls.

H.T. Distributers for Motor Cycles.

I find I was in error in a recent article when I said there were no machines fitted with single coil and contact-breaker plus a high-tension distributor. The Leader and Fairy machines are so fitted, as I am now informed by several correspondents. The Leader Motor Co. make a speciality of supplying this distributor to fit any standard engine, and it is undoubtedly a very desirable form of ignition, being, as most readers will know, no small factor in the speed proclivities of Napier cars, which are alleged to give five hundred revolutions per minute with this type of ignition above any with the magneto type.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Hill-climbing and Other Matters.

[3497].—Every motor cyclist must feel grateful for Mr. Wm. Wilson's letter [No. 3464], and should congratulate him on his perseverance in trying to obtain the pleasure there is in the sport of motor cycling.

It may interest one or two of your readers to know that I have seen Whitedowns (mentioned by Mr. William Percy) climbed by a two-speed Triumph, a single geared Triumph, and a twin Antoine. The last machine was geared $3\frac{3}{4}$ to 1.

A. R. HUNTER.

Cast-iron Headed Valves.

[3498].—With reference to "Ixion's comments in a recent issue on the breakage of cast-iron headed valves, I should like to point out that the screwed on head reduces the strength of the stem to that of the diameter at the bottom of the thread.

The correct method in my opinion is to shrink the head on, thus leaving the spindle same strength throughout. Several of my friends have had valves of this type running for over a year, and so far they have had no breakages with this method of attachment.

G. GRAY.

Formula in Hill Climbs.

[3499].—With regard to the formula used in the Coventry Hill-climb, I would like to point out that, although this is excellent for the ordinary motor cycle, it does not answer satisfactorily in the case of a machine such as the Scott.

This engine being two-cylinder and two-stroke is nearly equivalent to a four-cylinder engine.

The cylinder capacity as given in the programme is only taken as if the machine were a simple twin, no allowance being given for the double stroke. In addition to this, the engine, being water-cooled, received a consideration in the formula for the necessarily added weight, but no deduction from the result is made for the increased efficiency in hill-climbing on this account.

W. G. BOWER.

A Problem to be Solved.

[3500].—Some months ago I wrote you on the subject of to me a mysterious acceleration of engine revolutions when running with an infinitesimal lift of exhaust valve during the complete cycle of revolutions operated by the exhaust valve lifter (Bowden). The matter has lately been most emphatically proved to me that I venture to re-open it.

(1.) My twin Antoine 77 mm. x 80 mm. A.V. responds to this small lift when well warmed up. (Longuemare plain coils.)

(2.) My 6 h.p. A.V. single-cylinder flat belt drive (Longuemare Bassée-Michel trembler) accelerates distinctly on lifting valve whilst running under double load.

(3.) A friend's 3 h.p. Givaudan M.O.V. trembler F.N. carburetter causes him (a beginner) consternation on account of this same behaviour.

Some of your four-cylinder F.N. correspondents speak of an "abnormal condition" of running at present not accounted for. I offer the suggestion that perhaps some connection exists between their phenomenon and mine, inasmuch as the valves may rebound slightly or chatter after closing.

In view of my experiences of this curious phenomenon, I am sure there must be other riders who have shared them; in fact, one of your very early numbers had a letter from a novice on the subject, but I do not remember having seen any information or explanations offered, although I have never missed a copy of your most excellent paper.

AN 164.

[The explanation in this case is, we think, simple. The engines in question do not get sufficient air supply at critical speeds, and the slight raising of exhaust valve enables the piston to induce more air *via* the exhaust port.—Ed.]

[3501].—I notice in your issue of August 5th that the subject introduced by Mr. Ovington of America is still under discussion as a problem yet to be solved, but which I regard as being no problem at all.

Five years ago I had a machine fitted with a $2\frac{1}{4}$ h.p. engine and a surface carburetter, and when going for a run of forty or fifty miles it was common for me to remark that I would drive for the first ten miles or so; after that *the engine could drive itself*. It would positively roar away in this so-called abnormal state, always absolutely noiselessly, until the mixture was upset either by road shock or by lever manipulation. I have experienced this same state with a De Dion tricycle, surface carburetter.

If I failed to obtain this condition, I had not to seek far for the cause, i.e., the tappet or exhaust stem worn slightly. To remedy this I heated the end of exhaust stem, and drew it out a little with a hammer on an anvil.

As I have not experienced the same with other machines I have had since, and which have been fitted with spray carburetters, I attribute its actual occurrence, and its rare occurrence, to two points. First, its actual occurrence, which I prefer to describe not as an abnormal state, but as the natural state and working conditions of a petrol engine with perfect carburation and a perfect timing of ignition, which is in advance of spark lever range. As for the lubricating part of the question, I always obtained the best results with gas engine oil. Secondly, its rare occurrence, imperfection of timing, referring only to lift of exhaust valve, and imperfect carburation, bad roads and police regulations included, which makes driving artificial, and not in accordance with the natural requirements of a petrol engine, until, as your correspondent says, it takes the bit between its teeth and tears away.

Now, in connection with this subject, and to further demonstrate the so-called phenomena, and one or two more undiscovered eye-openers, I would suggest that we have a Marathon motor cycle race—in boxers' terms, a fight to a finish. This race could be run on the Brooklands Track, against which the End-to-end runs, etc., would be only as a gentle and a steady tour. Competitors to carry not less than one gallon of petrol, "or more," for many riders say that their engine would run all day if it was fed. In this race we should see what they will do on top speed, and see the day's running considerably lessened. It would also be an opportunity for the F.N. 4 to develop the abnormal state and maintain it, for which the conditions are perfect. It would have a great advantage in the gear drive, but belt-driven machines could be fitted with a jockey pulley, to be brought into requisition when required to tighten the belt.

In any case, I think it would be a very interesting race if it were run as an international race against time and consumption of petrol, stoppages on any account to disqualify for further part in the race.

RALPH P. ORMESHER.

[There is the Tourist Trophy Race in the Isle of Man, which will be run under practically similar conditions.—Ed.]

Motor Cycle Finish.

[3502].—I was greatly interested in the letter 3474, "Motor Cycle Finish." I have tried every kind of enamel, claiming all sorts of things, but the petrol, oil, and acids soon played havoc with the surface; in fact, in enamelling an old machine the cure is generally worse than the malady, because the machine soon gets the appearance of a faked up "jigger" looked upon with suspicion by everybody.

Some time ago I saw and admired a grey Westinghouse car, and was informed it was painted some nine months ago with a new enamel compound impervious to grease, acid, oil, and petrol. I obtained some and employed a practical painter to give two coats to my tricar. The whole cost was—painting, 6s.; enamel, 4s. 6d. The effect and wear in all weathers surprised everyone, and when I sold it it was taken

for a new machine (a 1906 Riley). The enamel is called Robbialac, and is made in this country by Jenson and Nicholson, of Warton Road, Stratford. One pint, at a cost of 3s., will cover about three motor cycles. I selected grey, which is a splendid colour to hide the dust and dirt.

FIRST AID.

Running on Naphtha.

[3503.]—I notice in your esteemed paper that a Mr. Cyril V. Abrecht recommends coal tar naphtha as a motor fuel.

May I be allowed to warn fellow motorists that crude coal tar naphtha, although it will drive a motor engine, is very unsuitable for this purpose on account of the large percentage of impurities, high boiling compounds, and creosote. Coke oven naphtha (a rather purer naphtha) even when redistilled has been tried and found wanting owing to the incomplete vaporisation of the fuel, and the consequent sooting, etc.

Motorists need have no fear, however, in using refined benzol (a water white liquid specific gravity .880) such as is marketed in some districts, but it must be refined.

I have used nothing else these two last seasons, and all I do is weight the float till the engine starts easily, when a little more air may be given when running.

My mileage is 130 miles per gallon, $3\frac{1}{2}$ h.p. Minerva, 1907. My mileage was 150-160 miles per gallon. 2 h.p. Minerva, 1903.

The engines when taken down after 1,000 miles were reported by the shop people to be in a normal condition.

As this is an English production, mainly extracted from coal gas, perhaps other cyclists have had experiences with it. May I invite them to relate them either good or bad, because I feel sure that all the bad times that may be related will be through using too much.

J. BELLERBY.

P.S.—The specific gravity of coal tar naphtha is .930 not .730, evidently a mistake of Mr. Abrecht's.

Bore v. Cubical Capacity.

[3504.]—Like Mr. A. W. Smith [letter 3472], I have for some time been interested in the relation of power to stroke, and in the main hold his opinion on the matter. But I remember reading in *The Autocar* some months back an article explaining why a long stroke engine gives more power than one with a shorter stroke, but same bore. It seems to me that the formula used by the Midland A.C. at the Shelsley Walsh hill-climb is on the right track, in assuming that the power varies as some fractional index of the stroke—in this case $(S)^{\frac{1}{3}}$, or $\sqrt[3]{S}$.

It would be very interesting to hear the results of properly conducted experiments to determine some simple formula for rating the power of engines with various strokes.

To compare two quite distinct performances by motor cycle engines, let us take as one example the flying half-mile of McMinnies, on the Triumph, on Brooklands, February 25th last. Stroke, 86 mm.; gear, $3\frac{1}{4}$ to 1; speed, 59.8 miles per hour. The piston speed works out at 1,420ft. per minute, with average engine revolutions of 2,512 per minute.

Again, from *The Motor Cycle*, of August 12th, page 635, we find a good performance by R. O. Clark, on the four-cylinder F.N., the stroke of which is 1 fancy 57 mm. In a ten miles race the average speed is approximately forty-six miles per hour, which, with a gear of 5.93 to 1 and 26in. wheels gives the number of engine revolutions as no less than 3,540 per minute, and a piston speed of 1,322ft. per minute. This seems to show that variation of stroke does not greatly affect piston speed under load.

The following method of securing gudgeon pin set-screws may be appreciated by some of your readers. In the boss into which the set-pin is screwed a slot is cut $\frac{3}{32}$ in. deep, corresponding with a hole drilled through the head of the pin. The latter is screwed right home and a cotter put into place and split, as per above sketch. The arrangement has acted very well on a 1906 twin, which had given much trouble through the screws falling out.

PRENTICE.

Carburettor Control.

[3505.]—A few months ago I purchased a $5\frac{1}{2}$ h.p. twin Griffon motor cycle, and had reason to find the carburettor fitted unsatisfactory. In looking round for another I chanced to be shown by the Service Co., of High Holborn, a new carburettor called the "Service Amac." It did not seem to differ very materially from the ordinary float feed spray type, except in the gas and air throttles, which were operated by a rack and worm system. I found the carburettor eminently satisfactory, with the exception of a jamming tendency in the throttles, caused by admission of dust.

This defect having been pointed out to the manufacturers, they very promptly discarded the design for the control, and made for me a new carburettor, similar in all respects to the discarded pattern, but the supply of gas and air is controlled by a device similar to the action of an inlet valve with a variable lift. There are two valves, the lower one being a cone but hollow in its centre, and which, when home on its seating, closes the holes for admission of extra air. This cone is hollow to allow the vapour from the jet to rise through the carburettor. The other valve has an ordinary coned seating, and admits the mixture to the induction pipe. The valves are kept closed by coiled springs acting against the pull of the Bowden lift. I have now given this carburettor a test over 500 miles at all speeds, and am so delighted with it that I feel more or less bound to bring it to the notice of fellow motor cyclists who are looking for a good and inexpensive carburettor. This carburettor was illustrated in *The Motor Cycle* recently. I should mention it is made in two types—one as described, with handle-bar control, and the other for ordinary rod and lever control. I have tried both, and prefer the handle-bar control.

To sum up, the good points are as follows:

1. Ease of starting (the throttle can be nearly closed, and prevents a hurried scramble for the saddle).
2. Increased speed on level and uphill.
3. Ability to crawl without tap fiddling or lifting exhaust.
4. Ability to climb a stiff hill slowly as well as fast.
5. Coolness of engine.
6. Low petrol consumption.
7. Silence of exhaust.
8. Sensitiveness of control.
9. Accessibility.

I trust the length of this letter will be atoned for by the benefit its insertion may confer on motor cyclists who are troubled with a twin that will not crawl when wanted.

RICHARD CREAK DAVIS.

P.S.—It should hardly be necessary to state that I am in no way whatever interested in the sale of this carburettor, nor have I got it from the makers or selling agents at anything less than the ordinary retail price.

Sidecars, Tyres, and Belts.

[3506.]—A few months back I purchased a 5 h.p. twin Vindec Special motor bicycle, and, after having the machine some weeks, attached a sidecar made for the right-hand side and fitted with flexible connections. I experienced considerable difficulty in steering the combination, and on grease the dangers of side-slip were, to my mind, greatly increased. Further, with the car attached to the right-hand side, there was a good deal of risk in overtaking large vehicles, on account of the fact that before I, as the driver, could obtain a clear view of the road ahead, I had the passenger out in the danger zone, and it would have been a difficult matter to get back if anything had made it necessary to do so. I took the sidecar to a cycle and motor agent in this district (Finchley), and he very quickly and cleverly converted it into a rigid car for the left-hand side, and I found the alteration in every sense a satisfactory one so far as steering and control are concerned.

With a 5 h.p. engine and rigid sidecar, however, I find that the life of the tyre on the rear bicycle wheel is very short. Already the tyre fitted to the machine when I bought it in early June has worn through to the canvas, with a mileage of only about 350 miles to its credit, in spite of the fact that it bears the name of one of the best known foreign brands and is of the "extra heavy" persuasion. The cover is now undergoing the process of retreading the while a second cover, this time a rubber-studded one, is looking decidedly the worse for wear after but 200 to 250 miles. I should be greatly obliged if any reader would kindly give me the advantage of his experience, who has met with good

results with rear wheel tyres fitted to a machine of high horse-power and with rigid sidecar.

I have been no more fortunate with belts than with tyres. I use a lin. rubber and canvas belt, and take great care that it is properly adjusted and in true alignment, avoiding running it too tight, and always removing it from the pulleys when the machine is standing and out of use. Yet one belt after another has gone, and the expense of running the combination is getting to be considerable, all on account of the belts and tyres, for neither the engine nor the machine have cost me a penny piece, and the former makes light work of the load with 19 or 20 stones up and the extra vehicle. The alignment of the sidecar and bicycle wheels has been given extra special attention, and more than one expert has said that the car is properly attached.

I have been thinking of making a tour on the machine with the car attached, but unless I can first learn where it is possible to obtain a belt and tyre that will give reasonable reliability, I shall feel compelled either to abandon the project or else carry a number of spare belts and outer covers with me.

H 4220.

Vexatious Delays.

[3507.]—Having been a devotee to the pastime of motor cycling for five years, during which time I have been a regular reader of your excellent paper, I have read with much interest the letters published recently on the treatment received by motor cyclists at the hands of the manufacturers. I was specially interested in Mr. Wm. Wilson's letter of August 5th headed "fair treatment," because I met with an accident identical with his of breaking the head off an inlet valve which knocked a hole through the piston head. I shall not apply his simile of "a penny in the slot," which I thought most appropriate in his case, because with me it was a case of 15s. out of my slot into the slot of the makers. Apparently, they do not consider that the same sauce is suitable for both goose and gander. It is now six weeks since I was astride my machine. The first three weeks were occupied in getting a new piston rod, and the last three in obtaining some small parts of my valve lifting gear, which through wear needed renewing. I still live in hopes of getting another ride before the summer is out.

After sending these parts to the makers I wrote and asked them if they considered the wear to be legitimate considering the mileage I had done, and in reply received a letter saying the parts had to be specially made, and would be forwarded as soon as finished. This letter cost me 2d., as it was unstamped. I would not have objected to paying 2d. for an answer to my question, but thought it rather dear for such information. I think this matter of promptitude in the despatch of small parts is a most important one, and one that should be taken up very seriously by motor cyclists as

a body. There is nothing more likely to undermine the popularity of motor cycling as a pastime than these awaits for small parts and the great lack of ordinary business methods in dealing with correspondence as shown by many firms I have dealt with. The firms who make a point of remedying these defects are the firms of the future, and the ones to whom I shall look to when purchasing a new mount.

MOCLIST.

Belts and their Fasteners.

[3508.]—My experience with a rubber belt may be of some help to your correspondent No. 3477, who has had trouble through the pin of the fastener tearing out of his belt. I had a Shamrock Gloria lin. belt from Messrs. Gamage, and they sent me a fastener with a bend to fit into the groove on the under side of the belt. I have used this belt on my $4\frac{1}{2}$ Minerva with sidecar for about 1,000 miles, and have had no trouble whatever with it nor does the belt show hardly any sign of wear.

B. G. BARNARD-SMITH.

SUMMARY OF CORRESPONDENCE.

Messrs. Phelon and Moore, Ltd., write, with reference to the article, "The Judges' Report on the End-to-end," in last week's issue: "It may interest your readers to know that on both the P. and M. machines in the End-to-end trials the chains had run nearly 1,000 miles before the start. In neither case were the chains from the engine to the gear adjusted, but the chain from the gear to back wheel was adjusted once on each machine. At the conclusion of the trials, the chains on each machine were examined by the judges, and found to be in perfect condition; in fact, the chains are to-day in as good condition as when they were first put on, and have probably several thousand miles of life before them. We are sending for your inspection a chain off one of our machines, which our customer informs us has run no less than 13,000 miles." [We find the elongation to be 1.025 of an inch in a length of 59.75 inches.—Ed.]

EXPERIENCES WANTED.

"M. J.," Ealing, would like to have readers' experience of the Lincoln Elk lightweight motor bicycles. Are they reliable and well built?

"Doctor" would like readers' experiences with the Roc two speed gear: (1.) Is it reliable? (2.) Is handle starting practicable? (3.) Has weight of gear and clutch any appreciable effect on wear of back tyre with or without sidecar?

"G.H." would like readers' experiences with regard to accommodation in Douglas, Isle of Man, during the Tourist Trophy Race.

Readers who send paragraphs for insertion under the heading of "Experiences Wanted" should enclose a stamped addressed envelope for forwarding replies.

The Hull and East Riding A.C.C. organised a 150 Miles Reliability Trial on the 13th inst. The above is a group of some of the competitors photographed at Newlands prior to the start of the competition.

CURRENT CHAT

SPECIAL FEATURES

STANDARD MACHINES IN
HILL CLIMBS.

HOW TO CAMP WITH A
MOTOR CYCLE
(Illustrated).

S.R. Jones '08

The T.T. Motor Cycle Race.

Mr. W. H. Bashall, who is competing in the Tourist Trophy Race for motor cycles in the Isle of Man on the 2nd prox., will ride his 6 h.p. twin at J.A.P., not his 3½ h.p. T.T. triumph as stated last week in the list of entries printed on page 653.

Case for Appeal.

We have pleasure in informing our readers that the secretaries of the A.C.U. and M.U. are in communication with the solicitor who defended Mr. Robert Sewell in the County Court case at Hexham on the 7th inst., and which is reported on page 677. The legal Committees of both organisations will consider the case in due course.

Police Scouts on Motor Cycles.

The Toronto police have recently purchased some British-made motor cycles, with the Brown, and equipped them with speedometers. In a recent police court case at Toronto the driver of a car swore that he was only travelling eight to ten miles an hour, but the motor cycle mounted officer stated that he had "paced" the motor car, and the speedometer on the motor cycle registered twenty-five miles an hour. A motor cyclist was also convicted on the same testimony, both defendants being fined £2 and costs.

Good Lightweight Performance.

We understand that the Douglas machine which completed the A.C.U. London-Plymouth-London twenty-four hours' run is the identical one that competed in the End-to-end Trials ridden by Mr. Eli Clark, no adjustment having been made to the engine. It is interesting to note that Mr. Clark's weight is thirteen stones; the performance is, therefore, a very good one for a lightweight machine.

Guippone's Record in Danger.

German racing motor cyclists are turning their attention to Guippone's one hour track record, which has stood at 102.3 kilometres since 1906. The track at Milbersthofer, near Munich, will be the scene of the attempt, as this is a fine surface, and is banked for very high speeds. Eugen Wienziens, for instance, has already ridden laps at the rate of seventy-five miles an hour. It was on this track that the French pace follower Paul Guingard, paced by Bertin, set up a world's record of nearly 100 kilometres in the hour.

Routes for the Holidays.

During the late summer we are constantly asked to give routes between various towns, and as our road experience is considerable we are always glad to help people in this manner. Our readers can in return be of considerable assistance to us in sending on a postcard any details which may strike them concerning the roads we have suggested, both as regards surface and gradients.

Tyres In the End-to-end.

Mr. T. K. Hastings, who competed in the A.C.U. End-to-end Trials, informs us that it was the general opinion of most of the competitors and observers that he used Goodrich tyres as stated in *The Motor Cycle* of August 5th. Mr. Hastings asks us to point out that each time he was credited with riding Goodrich tyres he contradicted the statement. The tyres fitted to Mr. Hastings's Indian motor bicycle were G. and J. tyres.

Jaffa to Jerusalem by Motor Cycle.

The interesting photograph which has been sent us by Lieut. Edward Noel depicts that gentleman outside the Hotel du Parc at Jaffa just before his departure for Jerusalem. Our readers will doubtless remember that Lieut. Noel originally intended to ride his Triumph motor cycle overland from India, but had to abandon the attempt at Jerusalem on account of the impracticability of riding over the extremely hilly country minus a change-speed gear. Referring to the picture, the basket in front is filled with spares, spare air tubes are strapped to the handle-bar, behind the seat tube is a spare oil tank, and on the carrier is a tank containing four gallons of petrol, with a toolbag at the rear. The rider's extra clothes, including a blanket, are contained in the long roll which is fastened round the carrier. Heavy voiturette tyres are fitted to both wheels.

Lieut. Edward Noel ready to start from the Hotel du Parc (Jaffa) for Jerusalem. Lieut. Noel intended to ride overland from India to England on his Triumph motor cycle, but when within a few miles of Jerusalem he was compelled to abandon the attempt. The equipment of the machine is described in a paragraph on this page.

WHITTLES' (PATENT) LINK-GRIP

Non-slip Endless Leather Belts for
MOTOR CYCLES, FANS, Etc.

No
fastening
link
required.
Shorten-
ing
simple
and easy.
Great
strength.

GAMAGES

**SPECIAL
TYRE
OFFER.**

To enable motor-
cyclists to test the
merits of the new

"Shamrock Excelsior" Rubber-Studded
Non-Skid Tyre, we will, until further
notice, allow purchasers of same a very
liberal allowance for their discarded
covers.

Made in all sizes of 26 and 24 inch (not 28).

An example; **26in x 2¼in. COVER, 50/-**
(Other Sizes and Prices on application)

Less our very liberal allowance for your old covers.

Your Opportunity, Seize it Now!

These tyres are made from the very finest rubber, they
afford complete immunity from sideslip.

The Studs are a considerable addition to the thickness of
the tread, which means greater durability and protection
from punctures.

The Studs form one part with the Tyre; they cannot
pull out, and on account of their great resiliency will not
slow the machine.

The well-known disadvantages of Metal Studded Tyres
are non-existent.

NO MORE LEAKY JOINTS.

The NEW "SHAMROCK-
EXCELSIOR" BUTT-ENDED
INNER TUBES (WITH THE
PERFECT JOINT).

NOTHING BETTER MADE.

Our price, 26 x 2¼in, 10/6.

Other sizes and prices on application

HAVE YOU HAD OUR MOTOR BOOK?

The "GRADUA" (Infinitely Variable) Gear for Belt-driven Machines.

NO END THRUST! NO JOCKEY PULLEY!! NO SLACK BELT!!!
SAVES PETROL. SAVES OVERHEATING. SAVES TYRES.
HANDLE STARTING—FREE ENGINE.

. . DIRECT DRIVE ON ALL SPEEDS. . .

This gear gives infinite variation from zero to $3\frac{1}{2}$ to 1. It is absolutely fool-proof.

No sudden jamming in of gear and wear and tear to the machine. A simple turn of a small wheel is all that is necessary. The rider gets full power of his engine by never overloading, and by keeping up the number of its revolutions.

Hills have no terror with a "Gradua" gear!

A perfect free-engine position is assured; the engine can be started with a handle and the rider take his seat while the machine is at rest.

All who have seen and tried it are enthusiastic about its many merits.

Nothing like it in the world! It will revolutionise the present system of variable gears.

To prevent disappointment, we would point out that it cannot be fitted to existing machines.

When ordering your new mount, **insist** on its being built with a "Gradua" gear. We are prepared to grant licences to other makers for building this gear under royalty.

The famous "Zenette" Spring-frame Motor Bicycle-de-Luxe will in future be built with "Gradua" gear, the price inclusive being 50 guineas nett cash.

Further orders for "Zenettes" with the "Gradua" must be placed **at once** if required for Summer delivery; we can accept a limited number only, as our present works are of limited capacity.

A "Zenette" fitted with a "Gradua" variable gear may be tried (by appointment **only**) at

ZENITH MOTORS, LTD. Showrooms: 119, Stroud Green Road LONDON, N.
 (Nearest Station, Finsbury Park).

Makers of the celebrated "Zenith" Bicar, price 43 guineas nett cash; and of the "Zenith" Tricar, price (with 6 h.p. J.A.P. twin-cylinder engine, chain drive, two-speed gear), 72 guineas nett.

The action of the "GRADUA" Gear is Simplicity itself. **NO COMPLICATIONS.**

RELIABLE.
NO RECHARGING.**

Police Traps

We have received information concerning the following measured distances in Richmond, Surrey, over which the police occasionally time motorists: Sheen Road, from the Fire Station to Thompson's Nursery; Queen's Road, from Park Road to Spring Grove House; Kew Road, from the Fountain to Lichfield Road, Kew. Also from Sandy Lane, Petersham, to the beginning of the tram-lines *via* Ham Common.

The Worthing Carnival.

In Class 2 in the Worthing Carnival and Regatta to be held on Wednesday, September 2nd, tricars and motor bicycles with sidecars and trailers will be eligible to take part in the competition for the best decorated machines.

An Autumn Open Hill-climb.

A large number of enquiries are being received regarding the South Eastern Association's autumn open hill-climb, for which a fresh hill has been selected. We hear that the plan adopted at the Catford Cycling Club's pedal hill-climbs will be followed, and a certificate awarded to every competitor who climbs the hill. This will be an innovation as regards motor cycle hill-climbing competitions.

Motor Union Provincial Meeting.

Motor cyclists will be made very welcome at the forthcoming provincial meeting of the Motor Union at Oxford on Sept. 19th. Arrangements are being made for parties of members to be conducted over the colleges by members of the University.

A.C.U. Council Meeting.

The next council meeting of the Auto Cycle Union will be held at Leamington Spa on Saturday, October 10th, an invitation having been received from the Town Council to hold the meeting there. Leamington is a most interesting place, and it is hoped that those affiliated clubs which can do so will make it their fixture for that day, and so help to make the meeting a great success. All propositions to be placed on the agenda of that meeting must be in the hands of the secretary by Friday, 18th September.

Six Qualify for One Prize.

A reliability run through the Erzgebirge, arranged by the Breslau branch of the German Motor Cyclists' Association, proved rather awkwardly successful for the organisers, no less than six getting through without a single bad mark, and thus qualifying for the first prize.

The Thoughtful Thunderer.

A morning journal publishes a paragraph suggesting the abandonment of the races in the Isle of Man. How thoughtful! Will some rival daily newspaper kindly suggest the suppression of fanatical paragraph writers? The Isle of Man course is guarded.

trophy, which was given by the well-known F.N. Co., of Herstell, was competed for among the members of the Liege Motor Cycle Club, who had to ride a touring motor cycle not exceeding a third of a litre capacity. Twelve competitors started. The results were: 1, Fagard, Sarolea, 2h. 18m. 36s., 251 points; 2, Marechal, four-cylinder F.N., 2h. 27m. 13s., 248; 3, Michel, four-cylinder F.N., 2h. 19m. 2s., 219; 4, F. Bertrand, Sarolea, 2h. 43m. 2s., 216. The next four riders to finish all rode F.N. four-cylinder machines.

The T.T. Motor Cycle Race.

The following additional entries have been received for the Tourist Trophy Race in the Isle of Man on September 22nd next: Mr. C. B. Franklin, 3½ h.p. Chater-Lea J.A.P.; Mr. S. C. Perryman, 5 h.p. twin Norton; and Mr. F. Applebee, 5 h.p. twin Rex. Intending entrants are reminded that entries for this race close on Tuesday, September 1st, and should be sent in at once to the secretary, Auto Cycle Union, 18, Down Street, Piccadilly, W.

International T.T. Prize Fund.

The following contributions have been received towards the Fund which has been established to provide prizes, and if possible help defray the expenses, necessarily very heavy, of holding the Tourist Trophy motor cycle race: *The Motor Cycle*, £5 5s.; Mr. A. J. Wilson, £5 5s.; Miss Muriel Hind, £5; Mr. J. W. Orde, £5; Mr. E. M. P. Boileau, 10s.; Mr. J. W. F. Tranmer, 5s. 3d.; Capt. Sir R. K. Arbuthnot, Bart., £1 1s. Further donations will be greatly appreciated, and should be sent to the secretary, Auto Cycle Union, 18, Down Street, W., as early as possible.

German Military Motor Cyclists.

The German War Office is learning to appreciate the volunteer motor cyclist. Last year it found employment for twenty riders, and having noted their services it now calls for more. In the Imperial manœuvres and other military exercises in various German districts it is proposed to employ 148 motor cyclists. The organisation of a motor cycle corps will probably soon be an accomplished fact.

FUTURE EVENTS.

- Aug. 26—Uxbridge C.C. Three Miles Motor Cycle Handicap.
- „ 29—Essex M.C. London to York and back ride, for members only.
- Sept. 1—Entries close for the Motor Cycle Tourist Trophy Race.
- „ 5—R.A.C. General Committee Meeting at Norwich. Members of the A.C.U. are invited to attend the various functions at Norwich.
- „ 12—Motor Cycling Club Petrol Consumption Tests.
- „ 12—Brooklands R.A.C. Meeting.
- „ 18—Motor Union Provincial Meeting at Oxford.
- „ 22—The International Auto Cycle Tourist Trophy Race in the Isle of Man.
- „ —Penalty Run for Members of the A.C.U. and Clubs in the South of England Districts affiliated to it.
- Oct. 10—A.C.U. Council Meeting at Leamington Spa.
- Nov. 20-28—Thirty-second Annual Stanley Show, at the Agricultural Hall, Islington.
- Nov. 28 to Dec. 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories

and accidents, if they occur, will not cause injury to the public, but the racers themselves. It would be just as logical to suggest the abandonment of the Grand National because it is the most dangerous steeplechase course in England. What say the islanders?

Belgian Motor Cycle Competition.

On the 9th inst. the Liege Motor Cycle Club organised a race over a distance of 125 kilometres in the neighbourhood of Bastogne. The competition was a closed one, and the

The start for the One Hour Scratch Race for *The Motor Cycle Challenge Cup*. Holder, H. V. Colver (2½ h.p. Matchless, 76×76 mm.) who repeated his last year's performance by coming in an easy first. Colver rode 52 miles 1,650 yards in the hour this year against his 51 miles 148 yards of last year. The previous best was C. R. Collier's 51 miles 540 yards at Canning Town, July 13th, 1907.

The A.C.U. Annual Race Meeting.

THE annual race meeting, which has been held regularly by the A.C.U. since 1902, when the races were actually held by the motor cycling committee of the A.C.G.B.I., now developed into the Auto Cycle Union, was held at the Stadium on Saturday last. The meeting was due to begin at 3 o'clock, but from 2.15 onwards it rained in torrents, so much so that R. O. Clark, who had ridden 130 miles to compete in the first heat of the second event, thought it was useless to turn up punctually and arrived too late. At 3 p.m. the rain ceased, and about half an hour

An exciting tussle took place between C. E. Bennett and C. R. Collier in the One Hour Race for *The Motor Cycle Challenge Cup*. In our picture Collier has the inside position, and Bennett is on the outside trying to pass. H. V. Colver, the ultimate winner of the race is lying third.

After it cleared up properly, and after the track had been queuegeed the first event took place, namely, the one mile time trials flying start for the *Automotor Challenge Cup*. The present holder of the record was C. R. Collier, time 1m. 2s., and the fastest time for the flying mile on the Stadium track was made by Colver on August 8th this year, time 1m. $3\frac{4}{5}$ s. The trial is open to motor bicycles fitted with engines where the diameter in mm. squared \times the stroke does not exceed 440,000. The times on Saturday were marred by the wetness of the track. The best performance was made by D. R. Clarke ($2\frac{3}{4}$ h.p. Century), time 1m. $5\frac{1}{5}$ s.; 2, C. E. Bennett ($2\frac{3}{4}$ h.p. Mansfield), time 1m. $6\frac{2}{5}$ s.; 3, H. V. Colver, 1m. $11\frac{3}{5}$ s. (second attempt; he was impeded by a competitor in the St. Martin's Harriers' Sports walking across the track during his first attempt); 4, C. R. Collier ($2\frac{3}{4}$ h.p. Matchless), 1m. 13s.; 5, R. G. Bell ($2\frac{3}{4}$ h.p. N.S.U.), 1m. $19\frac{1}{5}$ s.; 6, C. W. Standing ($2\frac{3}{4}$ h.p. Ioner), 1m. $38\frac{3}{5}$ s.

Next followed the Five Miles Tourist Handicap, open to machines conforming to the Auto Cycle Union definition of a touring mount, having engine dimensions not exceeding 90 mm. \times 90 mm., and a gear of not more than 4 to 1, with 26in. wheels.

Heat 1, J. C. Smyth ($2\frac{3}{4}$ h.p. Rex, 82 mm. \times 65 mm.), 30s. start; E. M. McPherson (4 h.p. Brooklands, 5 mm. \times 85 mm.), 30s.; F. Toman ($2\frac{1}{2}$ h.p. Laurin and Klement, 74 mm. \times 78 mm.), 35s.; G. L. Fletcher ($2\frac{1}{2}$ h.p. two-cylinder Moto-Rêve, 50 mm. \times 70 mm.), 90s. An exciting race took place between Smyth and Toman. The latter amused the spectators by jockeying his machine forward by swaying his body. The heat

resulted in a win for the little Moto-Rêve, with Toman second, and Smyth third, time 8m. $38\frac{2}{5}$ s.

Heat 2.—C. R. Collier ($3\frac{1}{2}$ h.p. 85 mm. \times 76 mm. T.T. Matchless-J.A.P.), scratch; W. Genn ($2\frac{1}{2}$ h.p. Eland-Minerva, 76 mm. \times 76 mm.), 20s.; H. W. Boulton ($3\frac{1}{2}$ h.p. Triumph, 82 mm. \times 86 mm.), 25s.; F. W. Applebee ($3\frac{1}{2}$ h.p. Rex, 82 mm. \times 89 mm.), 25s.; G. Aldington ($3\frac{1}{2}$ h.p. two-cylinder Kerry, 66 mm. \times 72 mm.), 30s.; W. Smith (2 h.p. Moto-Rêve, 50 mm. \times 70 mm.), 90s. The stand on Boulton's machine became detached, and he careered round the track with it trailing on the ground. Applebee, who was travelling well, shed his belt twice and retired. Result: W. W. Genn 1, C. R. Collier 2, W. Smith 3. Time, 8m. $3\frac{1}{5}$ s.

Heat 3.—H. A. Collier ($3\frac{1}{2}$ h.p. Matchless-J.A.P., 85 mm. \times 76 mm.), 10s.; G. Gibson ($3\frac{1}{2}$ h.p. Triumph, 84 mm. \times 86 mm.), 20s.; S. A. Denman ($4\frac{1}{2}$ h.p. Brooklands, 85 mm. \times 95 mm.), 30s.; R. G. Dendy ($3\frac{1}{2}$ h.p. Brown, 82 mm. \times 90 mm.), 35s.; C. W. Standing ($2\frac{3}{4}$ h.p. Ioner, 75 mm. \times 75 mm.), 40s. In this heat the late arrival, R. O. Clarke (5 h.p. four-cylinder F.N.), was allowed to start, but after travelling well for a few laps he retired. Gibson's performance was the *pièce de résistance* of the heat. He sped round the track, lapping competitors two at a time, and won amid the cheers of the onlookers. Result: Gibson 1, H. A. Collier 2, R. G. Dendy 3. Time, 7m. $45\frac{3}{5}$ s.

Then followed the event of the afternoon, the One Hour Scratch Race for *The Motor Cycle Challenge Cup* (limited to 76 mm. \times 76 mm. engines or the equivalent); holder, H. V. Colver, 51 miles 146 yards; best previous performance on the Stadium, Colver, 49 miles 220 yards. The starters were: H. V. Colver ($2\frac{3}{4}$ h.p. Matchless, 76 mm. \times 76 mm.); C. E. Bennett ($2\frac{3}{4}$ h.p. Mansfield, 76 mm. \times 73 mm.); C. R. Collier ($2\frac{3}{4}$ h.p. Matchless, 85 mm. \times 60 mm.); R. G. Bell ($2\frac{3}{4}$ h.p. N.S.U., 75 mm. \times 75 mm.); G. H. Gerhard ($2\frac{3}{4}$ h.p. Brooklands, 76 mm. \times 73 mm.); F. Toman ($2\frac{1}{2}$ h.p. Laurin and Klement, 74 mm. \times 78 mm.). Immediately after the start, Colver, Collier, and Bennett shone conspicuously above the others, the former rapidly drawing ahead, and a tremendous struggle ensuing between Collier and Bennett. It was a walk over for Colver, and a ding-dong struggle between the other two, first one and then the other maintaining the lead. The enthusiasm of the large concourse of spectators warmed to fever heat, and when Colver lapped Collier for the second time the Stadium resounded with ringing cheers. After about a quarter of an hour Bennett stopped with a broken contact breaker blade. He got going again, but broke a second one and retired. Throughout the whole hour the excitement never waned, and the race resulted in a glorious win for Colver, who easily broke his previous record, thus adding another win to the many successes of the Matchless machine. At the end of the ninth mile he was $2\frac{3}{5}$ s. inside record, at twelve miles $8\frac{4}{5}$ s., at eighteen miles 15s., at twenty-four miles $52\frac{4}{5}$ s., at thirty-three 1m. $40\frac{3}{5}$ s., and at forty-two miles 1m. 57s. inside record. The results stand as follows: 1, H. V. Colver, 52 miles 1,650 yards, beating record 1v 1 mile 1,110 yards; 2, C. R. Collier, 50 miles 380 yards; R. G. Bell, 44 miles 1,100 yards; G. H. Ger-

The A.C.U. Annual Race Meeting.—

hard, 40 miles 920 yards; and F. Toman, 40 miles 260 yards.

Next followed the Five Miles Open Motor Bicycle Handicap for the *Motor Car Journal* Challenge Cup; holder, C. E. Bennett; open to machines with engines where the diameter in mm. squared \times the stroke does not exceed 440,000, or 76 mm. \times 76 mm.

Heat 1.—There were only two starters, D. R. Clarke ($2\frac{3}{4}$ h.p. New Century, 76 mm. \times 76 mm.), 10s. start, and E. W. Caswell ($2\frac{1}{2}$ h.p. Caswell, 70 mm. \times 76 mm.), 50s. Result: Clarke 1, Caswell 2. Time, 7m. 36 $\frac{4}{5}$ s.

Heat 2.—C. E. Bennett ($2\frac{3}{4}$ h.p. Mansfield, 76 mm. \times 73 mm.), scratch; H. V. Colver ($2\frac{3}{4}$ h.p. Matchless, 76 mm. \times 76 mm.), 5s.; G. H. Gerhard ($2\frac{3}{4}$ h.p. Brooklands, 76 mm. \times 73 mm.), 45s. Result: Colver 1, Bennett 2. Time, 6m. 24s.

Heat 3.—C. R. Collier ($2\frac{3}{4}$ h.p. Matchless, 85 mm. \times 60 mm.), scratch; R. G. Bell ($2\frac{3}{4}$ h.p. N.S.U., 75 mm. \times 75 mm.), 40s. Result: Bell 1, Collier 2. Time, 6m. 18s. Collier failed to catch up Bell, who travelled in excellent form.

The final of the Five Miles Tourist Handicap: Starters, G. L. Fletcher, W. Genn, C. Collier fastest loser, and Gordon Gibson. Collier unfortunately failed to start. Gibson proved an easy winner, time 7m. 30 $\frac{2}{5}$ s. Genn was second, 8m. 40s., and Fletcher third, 8m. 49 $\frac{1}{5}$ s.

The last event of the day was the final of the Five Miles Open Handicap. It was quite dusk, and the flames from the exhaust and the explosions in the bored cylinders were quite visible.

The starters were: D. R. Clarke, H. V. Colver, H. G. Bell, and C. R. Collier fastest loser. Colver's good fortune forsook him, and he retired early with a broken belt; it was, however, an excellent race. Result: Clarke (1), time 6m. 16s.; 2, R. G. Bell, 6m. 32 $\frac{1}{5}$ s.; 3, Collier, 6m. 37 $\frac{4}{5}$ s.

Thus ended a most successful meeting. Although the St. Martin's Harriers held their sports at the same time, the spectators never lost for a moment their interest in the A.C.U. meeting, and the result of their intense enthusiasm serves to prove that motor cycle racing is, without the faintest suspicion of exaggeration, one of the most popular forms of sport in existence.

MURATTI TROPHY RELIABILITY TRIALS.

THE annual two days' reliability trials for the Muratti Trophy, presented to the Ulster Centre, M.C.U.I. by Messrs. B. Muratti, Sons, and Co., Ltd., Manchester, commenced on the 21st inst., the first day's ride being to Dublin from Belfast and back—a distance of 200 miles. The trial consists purely of reliability, and is judged by the ability to run to schedule. Each day's ride is divided into two sections, each section being divided into four sub-sections, and a time schedule is arranged showing when the competitors should pass through each station if travelling at the rate of twenty miles an hour. Ten marks are allowed for each sub-section, one mark being deducted

other riders kept forging ahead. At Dublin, Stewart, Murphy, Kennedy, O'Rawe, Blake, Moles, and McCann had secured full marks, notwithstanding that it rained throughout the journey. After a two hours stop for lunch the return ride was commenced at two o'clock, the rain having ceased by this time. O'Rawe, McCann, and Moles lost marks on the way, and when Balmoral was reached Stewart, Murphy, and Kennedy were the only riders having full marks at the end of the first day's ride, though all except Carlisle reached the finishing point. The machines were locked up over night in the Rover Co.'s garage, no adjustments or repairs of any kind being permitted.

the second day's
ride.

for each minute or part of a minute over or under schedule time. Ten minutes' grace was allowed either under or over, but beyond that riders could not qualify for an award. The following started: J. Stewart (holder), ($3\frac{1}{2}$ h.p. Triumph); C. E. Murphy and J. J. Kennedy ($3\frac{1}{2}$ h.p. Triumphs), J. S. Garrett ($3\frac{1}{2}$ h.p. Rex), R. Sharpe ($3\frac{1}{2}$ h.p. N.S.U.), J. J. O'Rawe ($3\frac{1}{2}$ h.p. Rex), A. V. Blake ($3\frac{1}{2}$ h.p. Triumph), F. A. Carlisle ($3\frac{1}{2}$ h.p. Minerva), T. Moles and John McCann, Manchester ($3\frac{1}{2}$ h.p. Triumphs), J. Newell (3 h.p. Triumph), and W. J. Andrews ($3\frac{1}{2}$ h.p. Rex). Rain fell heavily at the start, and the roads were in a very bad condition. Checking stations were arranged at Bambridge, Dundalk, Drogheda, and at the turning point Tolka Bridge, Drumcondra. In addition to these, there were secret controls at various places on the route.

Before the first control was reached J. Newell retired, being troubled with leaky valves, and at Newry J. S. Garrett broke a petrol tube, which caused his retirement also. The

The weather conditions were very much better when the riders reached the starting point for the second day's journey. The roads had dried considerably, and in bright sunshine the following were despatched: J. Stewart, C. E. Murphy, J. J. Kennedy, R. Sharpe, J. J. O'Rawe, A. V. Blake, T. Moles, J. McCann, and W. J. Andrews. Checking stations were arranged at Larne, Cushendall, Bushmills, Limavady, Londonderry, Downhill, and Ballymena. The luncheon interval took place at Limavady, and at this point all the riders, except Moles, had secured full marks. At the next control Blake lost marks, but the other riders continued to ride exactly to schedule, and reached the finishing point promptly to time. We hope to give the result next week.

The address of Messrs. G. T. Riches and Co., appearing in the paragraph on page 643 last week, is an error. The proper address is 19, Store Street, W.C., where applications for the No. 8 catalogue should be sent.

Inter-club Meet of Midland Motor Cyclists.

THE first annual meet of Midland motor cycle clubs was successfully held at Stratford-on-Avon on Saturday last. Unfortunately, the weather was somewhat unpromising, and of the ten clubs which finally expressed an intention to be present, only six were represented. About sixty motor cyclists sat down to tea at the White Swan, several ladies being present.

At a meeting of club secretaries held in the evening it was resolved that the meet be made an annual event, that Stratford-on-Avon be the rendezvous, and that next year's meet be held on Whit-Monday. Further particulars of what transpired at the meeting will be published next week. There is every indication that next year's meet will be three times as large as the one just held.

The Inter-club Meet of Midland Motor Cyclists at Stratford-on-Avon on Saturday last. Six clubs were represented, viz., the Birmingham, Burton-on-Trent, Coventry, Oxford Bocardo, Sutton Coldfield, and Worcester Motor Cycle Clubs.

Speed Trials at Portmarnock.

THE speed trials of the Dublin Centre of the Motor Cycle Union of Ireland at Portmarnock on Saturday last were remarkable for the fine performance of Mr. C. B. Franklin. Always a consistent performer in these events, he quite excelled himself on Saturday last by winning three out of four events. He was mounted on a new $3\frac{1}{2}$ h.p. Jap racer and an illustration of this machine will be found on page 660).

which he proposes to use in the Tourist Trophy Race. The speed he was able to get out of this comparatively small engined machine was wonderful. In the twenty miles handicap he covered the distance in 28m. 52 $\frac{1}{2}$ s., and the merit of the performance will be appreciated when it is mentioned that the course was an out and home one of a mile, necessitating a turn round a flag at each end of the course. The fourth race was won by R. Walshe.

CLUB NEWS.

Essex M.C.

Members are reminded that the twenty-four hours run from Woodford to York and back takes place on Saturday next, the 29th inst., starting from the Castle Hotel, at 7 p.m.

Manchester M.C.

The above club's petrol consumption test for motor cycles and cars held on Saturday last resulted as follows: A. J. Moorhouse ($3\frac{1}{2}$ h.p. Triumph), 148 miles per gallon; Harry Reed (4 h.p. Dot), second. This rider failed to wait for an official to check his distance, and other competitors made the same mistake, so the second prize was awarded to C. E. Kettle ($3\frac{1}{2}$ h.p. Triumph).

Sunderland and District M.C.C.

This club held a speed-judging contest on Wednesday evening August 19th, over a course of seven and a half miles. There were eleven entrants, who were despatched at intervals of five minutes each. The speed set was eighteen miles per hour for all, the winner being J. Kirton ($3\frac{1}{2}$ h.p. Minerva), who finished $\frac{1}{4}$ s. late.

Bolton and District M.C.C.

The Bolton and District Motor Cycle Club held its hill-climbing competition on the 15th inst., divided into two classes for single and twin-cylinder motor bicycles. A. J. Moorhouse (5 h.p. Twin Rex) won the medal for fastest time in the twin class, and also the gold medal for best placing on formula; R. L. Clegg (N.S.U.) the bronze medal for second fastest time. In the single-cylinder class J. Entwistle ($3\frac{1}{2}$ h.p. Triumph) won the medal for fastest time, also the bronze medal for second position on formula. The winner of the gold medal for best placing on formula in the single class was H. T. Batten (3 h.p. Sarolea).

Newcastle and District M.C.C.

On Saturday next the above club will hold a non-stop competition starting at 10 a.m. from the second milestone on the Barrack Road, Newcastle-on-Tyne, to Jedburgh and back to Newcastle. Three prizes will be awarded, and bronze medals to all who fulfil the conditions of the trial.

Crewe and District M.C.

This club will hold a members' hill-climbing competition on Saturday next, the 29th inst. A gold medal will be presented to the member accomplishing the best performance on formula, and a silver medal to the member making the slowest timed ascent.

Hull and East Riding A.C.C.

The meet and hill-climb at Elsham, announced for Saturday, August 22nd, had to be postponed. The decision of the judges re the non-stop run held on August 13th has not as yet been received. The machines in the hill-climb on Saturday next at Spout Hill, Brantingham, will be weighed at Mr. G. A. Brown's farm, Brantingham (by kind permission), and a standing start will be made.

Richmond and District M.C.C.

On August 15th and 16th the members of the Richmond and District Motor Cycle Club competed for the trophy kindly presented to the club by the Marquis de St. Mars. The competition consisted of a run to Hastings and back, in which one mark was deducted for every minute spent in making any repair or adjustment. As neither Mr. Lankester nor Mr. Blois lost any marks a further speed judging run was held on the Wednesday. The trophy was won by Mr. K. Lankester, who was only 1m. 5s. too fast. Medals were awarded to all who made a non-stop run.

Club News.—

Hartlepoons and District M.C.

Will hon. secretaries of motor cycle clubs kindly note that the address of the hon. sec. of the Hartlepoons and District M.C., Mr. Walton, jun., has been changed to Weardale, Station Lane, Seaton Carew.

Yarmouth and District M.C.C.

The Yarmouth and District Motor Cycling Club are holding a gymkhana on the Recreation Ground, Great Yarmouth, on the 10th prox. Motor cyclists belonging to any recognised club will be eligible to take part in the competition, and should they desire to do so they are requested to communicate with the secretary, Mr. Valentine H. Blake, Park View, Great Yarmouth.

Edinburgh M.C.C.

On the 1st inst., the Edinburgh Motor Cycle Club held a fifty miles reliability trial, in which was included a fast and a slow hill-climb. The start was from Fairmilehead to Biggar by West Linton, and back by Skirling and Leadburn to Fairmilehead. The slow hill-climb was on Hillend Hill,

and the fast on Flotterstone Hill. The competitors were required to keep up a speed of twenty miles per hour, and in order to prevent that speed being exceeded two secret controls were made, one at Blyth Bridge and one on Seafeld Road, at both of which marks were deducted from anyone exceeding the limit. Of the ten starters, all arrived home in time to gain the full 500 marks for reliability. The result, after adding marks gained in hill-climbs, and deducting marks lost at controls, was as follows:

James R. Alexander (twin Vindec)	... 656 marks
P. E. Tolfree (twin Roc)	... 535 "
R. A. Macmillan (four-cylinder F.N.)	... 530 "
Alfred Alexander (twin Rex)	... 525 "
E. L. Matthew (four-cylinder F.N.)	... 517 "
J. A. Forrest (single-cylinder Triumph)	511 "
T. Durie (single-cylinder Triumph)	... 508 "
C. H. Macmillan (four-cylinder F.N.)	... 494 "
Dr. Clark (single-cylinder Triumph)	... 493 "
E. Lenthardt (single-cylinder N.S.U.)	... 493 "

The fastest in the fast hill-climb was E. L. Matthew, and the slowest in the slow hill-climb was P. E. Tolfree.

View of the hill, near Northop, on which the Liverpool M.C. had arranged to hold a hill-climbing competition on the 15th inst. At the last moment the police intervened and prohibited the contest. It will be noticed that there is not a single habitation in sight, or any traffic on the hill.

HINTS AND TIPS FOR MOTOR CYCLISTS. By Road Rider.

(Concluded from page 610.)

SQUEAKS ON TRICARS.

255. Squeaks on tricars often arise from the springs. If slots are provided, work grease in between leaves with a knife blade, first taking load off springs by means of screwjack.

TESTING HIGH TENSION CIRCUIT.

256. Never remove a sparking plug unless there is grave reason to suspect it. The high tension circuit may be tested by laying a screwdriver with its blade touching plug terminal, and just not touching engine while contact is made or broken, but this is no guarantee of the plug being in order.

SPROCKET FASTENINGS.

257. The rear wheel chain sprockets on all but the smallest tricars are bolted to a disc of the rear hub. It will be found that in time these bolts and nuts shake loose; many of them may be dropped on the road before notice is taken, and the hub will then be spoilt if the machine is driven further; or if the looseness is discovered in time, they are highly inaccessible, and much time will be wasted in tightening them properly. I find the best method is immediately on receipt of a new tricar to take off the nuts and bolts and put a soft leather washer on each bolt close to its head. Then thread the bolt through the disc and sprocket, and place another washer on it before replacing the nut. Screw nut

up as tight as it will go with a tube spanner, and cut off superfluous length of bolt, leaving only a thread or two projecting outside the nut. Then take a snub-nosed punch and a hammer, and rivet or burr over end of bolt. The nut will then never come loose, and if at any time a new sprocket is required, very little force is needed to get the nut off the bolt.

TIGHT BOLTS.

258. A bolt that fits tightly in its bed must never be knocked out direct or the thread will be spoilt. The best plan is to take a copper or brass punch of smaller diameter than the bolt, hold it carefully in centre of bolt end, and give it a very smart tap. Failing this, a piece of tough wood, sheet lead, or copper may be laid over bolt end before hammering, or the nut may be half unscrewed, and the nut itself hammered, but in this last case the thread is in danger if the bolt be really tight.

TIGHT NUTS.

259. If a nut cannot be loosened, tapping is the first expedient. Screw a long-handled wrench firmly on to nut, and tap its far end smartly with a hammer or weight. If this fails, run paraffin round nut and try again. A pair of red hot tongs held around the nut are then the best resource, but failing these, a cold chisel and hammer may be used to start the nut.

TREMBLER BLADE LOST' SPRING.

260. In time any trembler blade may lose its temper or acquire a set, and so cause very sluggish running of the engine. If no spare is available, a piece of whalebone or clock spring, rather less in length than the erring blade, may be drilled to slip over holding screw, and put behind blade to stiffen it.

WHEEL BEARINGS.

261. Every now and then raise wheels off ground, seize by the rim, and shake. If there is any side play tighten cone till wheel is absolutely stiff, slack back a quarter of a revolution, and lubricate. A tight wheel bearing or a dry wheel bearing is a common source of bad running.

Lubricate hubs every 250 miles.

WIRING.

262. Novices should procure from the makers of their machine a sketch of the wiring, and always carry it with them. This is especially advisable with twin-cylinder machines. Where there is possibility of doubt between two wires, as at coil, accumulator, contact breaker, or sparking plugs, one wire and one terminal should be marked for each other with red paint.

The above "HINTS AND TIPS" will shortly be reprinted in book form.

HOW TO CAMP WITH A MOTOR CYCLE.

By ALEX. P. MOELLER and J. ROBERTSON BRIDGES.

THE great interest taken in the light camping kit exhibited at Mr. A. Candler's lecture before the members of the Auto Cycle Union in the early part of this year leads us to believe that a little guidance and advice will be welcomed by readers of *The Motor Cycle*.

The steady growth of the camping movement and the increasing popularity of motor cycling should result in a very large addition to the ranks of motor cycle campers.

There is no need to prove the practicability of the thing; it has been, and is being, done with marked success. Apparently one of the chief obstacles in the minds of motor cyclists is the limited space available on a motor cycle when compared with the pedal machine.

Having been a camper for the last six years, and having owned during that time eleven different makes of motor cycles, one of us has no hesitation in saying that there is no difficulty whatever in carrying the most luxurious kit. A complete outfit for two people, with the exception of the second man's (or lady's) sleeping gear, is packed away in the baskets shown in the illustrations.

In the right-hand pannier are the stove, toaster, spirit stove for boiling shaving water, methylated spirit flask, pots, pans, cups, cutlery, shaving tackle, all packed carefully between the dish cloth, dish towel, and spare socks to prevent rattle. The left pannier contains down quilt and sleeping bag. In the large basket are cottage tent, ground sheet, ground blanket, flysheet, pegs, bucket, eight plates, one quart milk bottle, rubber shoes, candelabra, candles, towel, soap, tablecloth, collars, vest, handkerchiefs, down pillow, repair outfit for stove, salt, sugar, pepper, mustard, six kippers, quarter of a pound of butter, box of

cheese, bread, coffee, etc. On the handle-bars the poles and a rabbit rifle are lodged. In addition to the above array, the toolbag on the handle-bar and one on the carrier contain every possible tool and spare that could be required by the most exacting motor cyclist.

It is most important that the packing should be done very carefully, the soft articles forming a padding for the hard. Every little corner and crevice should be taken advantage of, and when packed the baskets or bags should be practically solid right through. Two web straps hold the handle-bar articles, two others the pannier bags, and one long strap the large basket, which, resting on the top edge of the panniers, prevents them from flapping sideways. This method of strapping to the machine renders the luggage absolutely rigid, and yet enables the complete kit to be detached in three minutes and replaced in five.

We will now turn our attention to details of the

kit, which has been much lightened of late and rendered yet more compact. Many of the articles have been evolved from the continual and practical experiments of members of the Association of Cycle Campers.

The Tents.

These are many and various, but fall generally under three heads: The "A" (original), Cottage (two sizes), and the Gipsy (three sizes). The Cottage and Gipsy are the most used, especially the latter, which is an excellent touring tent, as it can be pitched in less time, has only two guys, and requires much

less ground space. With the Cottage a flysheet or double roof is essential. The poles are of bamboo, made on the fishing rod jointed principle, and are of wonderful lightness and strength. The rubber ground sheet effectually prevents any damp from penetrating, however wet the ground may be. Over the sheet is spread a thin woollen blanket.

Meals.

There is nothing in the way of stoves to beat the Primus. Spirit stoves are slow, and, whereas paraffin

Sketch showing the method employed for strapping the pannier bags securely to the motor cycle rear carrier.

screen, bucket, wash basin, toaster and pot ring for stove have all been specially designed with a view to the utmost reduction of weight and bulk. Spoons, forks, milk bottle, and condiment box are all of aluminium, but enamelled mugs and plates of the lightest make are preferable to those made of this metal.

Sleeping Gear.

This depends somewhat on the time of the year and the nature of the season; some campers require far more covering than others. Generally a sleeping bag, slightly bifurcated, is carried and a down quilt with a special valance.

Weights and Dimensions.

Single Gipsy, 6ft. by 4ft. by 3ft. 9in., complete (tent,

poles, pegs, ground sheet, and ground blanket) 4½ lbs.; this will sleep two at a pinch. Large Gipsy, 6ft. 6in. by 5ft. 9in. by 5ft. 3in., complete 8½ lbs.; will sleep two or three. Large Cottage, 6ft. 6in. by 6ft. 6in. by 5ft., complete with flysheet, 12½ lbs.; will sleep three or four. For nearly seven years now these tents have been put to every possible test in all weathers at all seasons of the year.

Camping Sites.

Practically every farm in the country is a camping site, provided there is some slight shelter to be had, preferably a hedge. A hospitable and kindly welcome is invariably the rule. An armful of straw early in the year or during a particularly wet season adds to the comfort of the tent, but scores of campers never use it.

A barn or outhouse is generally available as protection for the "steed," but if not, the cycle can be left out with a covering of oiled lawn, and will come to no harm.

The Advantages of the Camp.

Independence, whether of inns, hotels, or—break-downs. No need to push the machine for miles in search of a resting place. One can pitch camp and repair any damage at one's leisure. A sojourn amidst the beauty spots of your native land, not to be surpassed, or indeed approached by any "command of the sea" or "view of the hills" from the windows of a fashionable hotel. Economy and increased pleasure and health.

We shall be pleased to answer any enquiries that readers may care to address to us, c/o the Editor, and give further advice.

A CASE FOR APPEAL.

THE decision of Judge Greenwell in the county court case quoted below will come as a great surprise to all motor cyclists. The decision is contrary to anything we have previously read or heard of, and such a miscarriage of justice that it is likely to have far-reaching effects on the pastime unless prompt action is taken to appeal against it. We print the newspaper report of the case, extracted from the *Newcastle Daily Journal* of August 8th:

"A MOTOR CYCLE DECLARED A NUISANCE."

"At Hexham County Court on August 7th, his Honour (Judge Greenwell) had before him a case in which Andrew English, Acomb, claimed £50 damages from Robert Sewell, Hexham, for injury to himself and his trap by the negligent riding of a motor cycle by the defendant on the road between Acomb and Hexham on the 1st February, or in the alternative for damages for injury by the defendant placing a nuisance on the highway. After hearing the evidence, his Honour held that there was no negligence, but under the circumstances of the case he was satisfied that this machine was a nuisance, and therefore the defendant must be held liable. If the parties could not agree as to damages that would have to go to the registrar for settlement. Mr. B. D. Gibson, solicitor, Hexham, was for the plaintiff, and Mr. J. A. Baty, solicitor, Hexham, for the defendant."

We have communicated the decision in this case to the secretaries of the Auto Cycle Union and Motor Union, who have the matter in hand, and in addition

we have submitted the paragraph to our legal adviser, who has replied as follows:

"The judgment of the Hexham County Court will no doubt be disregarded, and is not binding on other judges, as county courts are only inferior courts. It may be possible for any particular motor cycle to be a nuisance, but a motor cycle as such is not a legal nuisance, and a claim for damages on the ground that a motor cyclist is placing a nuisance on the road ought not to be upheld. It will be remembered that the Locomotives on Highways Act, 1896, provided that the enactments referred to in the schedule to such Act should not apply to light locomotives (including, of course, motor cycles). Amongst such enactments is the Locomotives Act, 1861, Section 13, which provides that anyone using on a highway a locomotive so constructed or used as to cause a public or private nuisance shall be liable to an indictment or action. This does not now apply to motor cars and motor cycles. If the judge held that a motor cycle was in itself a nuisance his decision should be appealed against."

In the interests of motor cyclists this is obviously a case which should receive very prompt attention at the hands of one or both of the organisations above mentioned. We hope to be able to announce elsewhere that an appeal will be lodged.

H. P. Rose, Ltd., have opened a branch establishment at Bedford Place, Brighton, where they are acting as agents for Douglas and N.S.U. motor cycles.

RECENT PATENTS.

By ERIC W. WALFORD, F.C.I.P.A.

A Mechanical Horn.

Although this construction is not likely to be universally adopted, a short description may be of some interest. The horn A has a reed of the usual kind, and is provided with a bellows B, normally held open by the spring C. Mounted on a pivoted lever D is a friction wheel E, which can be brought into contact with the tyre F by pulling the cord G. Attached to the periphery of the friction wheel E is a cable H, and this cable runs over a pulley, and is secured to the movable side of the bellows B. Thus when the friction wheel is brought into contact with the tyre the bellows will be operated and the horn sounded. From the relative dimensions of the wheels in frictional contact, it appears that the horn would be sounded about nine times for each revolution of the cycle wheel.—K. Gabriel, No. 27,359, 1907.

A Two-speed Hub Gear.

This gear is of the type in which two driving chains are employed. The hub shell A is mounted on ball bearings on abutments B and C formed integral with the high and low driving chain wheels D and E respectively. These chain wheels are mounted freely on ball bearings F on the spindle G, which spindle is formed hollow for the passage of the operating rod H. Carried centrally within the hub is a sliding double jaw clutch J, which must always rotate with the hub owing

to feathers K. The teeth of this jaw clutch J are adapted to engage with corresponding teeth L and M on the abutments B and C respectively. The double jaw clutch is actuated by a crosspiece P fixed on the operating rod H, and is normally held in engagement with the teeth on the high speed abutment C by the spring N, the low speed abutment

then being free. When the clutch is in the position shown in the drawing, the hub is free of both abutments, and no drive can take place. When the clutch is drawn into engagement with the abutment C, the low gear is in operation and the high gear abutment is free.—A. Readhead, No. 18,389, 1907.

A New Variable Pulley.

The fixed pulley flange A is integral with a sleeve B, which is secured to the engine crankshaft. The movable pulley flange C is screwed on to a short sleeve which is connected to a collar D. This collar is provided with a number of pivoted catches E adapted to engage recesses F in the fixed pulley sleeve B, and which are normally held in their operative position by springs G. Adjacent to the movable flange

is a second collar H having a bevelled edge J. This collar is adapted to be moved laterally by a peg and inclined slot device (not shown). When this is effected the bevelled edge

J acts upon the ends of the pivoted catches E to withdraw them from engagement with the sleeve B. This allows the movable flange to be slid laterally to vary the distance between the flanges.—D. Carter, No. 18,036, 1907.

A Front-driven Tricar.

This invention relates to a form of tricar which was recently described in this paper. The front wheel A is carried in the forked lever B, which is pivoted at C to the usual rigid fork. This fork also carries the engine D. The free ends of the pivoted lever B are controlled by springs E, providing a spring suspension. In the construction illustrated, transmission is by belt to the countershaft F, and thence by chain to the wheel A.—F. L. Huttel, No. 4,711, 1908.

An Exhaust Silencer.

The exhaust gases enter the silencer through the inlet and strike the face of the cone B. They then expand in the chamber C, and escape through the perforations D into E

Here the gases are directed by the inclined plane F toward the perforations G, through which they pass into the annular chamber H, and thence to the atmosphere through the perforations J.—B. F. R. Collyer, No. 8,505, 1908.

MOTOR BICYCLES FOR SALE.

EEDS.—3½ h.p. 1906 Rex, spring forks, good running order; £13.
EEDS.—2½ h.p. Minerva, girder forks, engine first-class order; £11 10s.
EEDS.—2 h.p. Minerva, girder forks, good running order; £6 10s.
EEDS.—2½ h.p. De Dion, Chater-Lea frame, long handle-bars, good hill-climber; £12 10s.
EEDS.—5 h.p. Twin Rex, spring forks, 2½in. tyres; £16 10s.
EEDS.—2½ h.p. Lightweight; wants coil and carburetter; £5.
EEDS.—2½ h.p. Kerry; just overhauled, and frame enamelled green; £12.
EEDS Motor Exchange, 28, Dock Street.

2 h.p. Triumph, newly overhauled, new Palmer back; £11.—61, Haddon Street, Fiddlough.

1907 Twin Rex, perfect running order; £20; exchange entertained.—45, Infirmary Road, Sheffield.

5 h.p. Twin-cylinder Roc, two speeds, in good order; £25.—Hitchings, Ltd., 74, Cold Street, Liverpool.

5 h.p. Lloyds, 26in. by 2½in. Palmers, spares, etc., in good condition; £16.—Lugden's, Contractors, Low Moor, Bradford.

11 h.p. White and Poppe, low built, fast and reliable, only wants seeing; £17.—46, Stather Lees Road, Sheffield.

11 h.p. Rex Tourist, magneto, fine condition; £22.—Dairs, 191, Brunswick Street, Oxford Road, Manchester.

NEW 1909 Model 3½ h.p. Phelon and Moore, two speeds, Palmer tyres in stock. —Potter, Agent, Blenheim Square, Leeds.

11 h.p. Quadrant, Shamrock-Excelsior, non-skid, footboards, Whittle belt, no medals; price £18.—163, Park Road, Bolton.

11 h.p. Rex, splendid order, spring forks, all spares; £15; appointment by letter. —P. Thorougood, Waterloo, near Liverpool.

11 h.p. Centaur, low built, 26in. wheels, 32 Palmer tyres, chain drive, free engine; perfect order; £16 lowest.—Lawson, Burley Mount, Leeds.

11 h.p. N.S.U., magneto, spring forks, excellent condition; £19, or exchange for 1908 Moto Reve.—Tranmer, 133, Victoria Road, Scarborough.

MINERVA, standard model, almost new, Continentals, spring forks, perfect condition; bargain.—Barlow, Victoria Terrace, Kearsley, Farnworth.

21 h.p. Viper Motor Cycle, Jap engine, 28in. 22 Clipper tyres, 23in. frame, not ridden 500 miles, guaranteed sound; £12 10s.—Leach, 19, Leonard Street, Hull.

11 h.p. Rex, splendid condition throughout; a genuine bargain; only wants seeing; £14.—Crompton, Coal Merchant, 103, Edinboro' Street, Goole.

4 h.p. Roc, July, 1908, two-speed, Druid spring forks, Shamrock-Excelsior back, Whittle belt, lamp, horn, spares; £35, or offers.—21, Loxham Street, Bolton.

TRIUMPH, 1908, lamp, horn, and spares, like new, footrests, fastest time in single class Bolton and District Hill-climb; £38.—Jos. Entwistle, 322, Manchester Road, Bolton.

11 h.p. 1904 Rex, perfect, new tyres, belt and spring forks, footboards, bargain; £12; 2½ h.p. Bradbury, perfect, £10; wanted, screw-cutting lathe.—Fairhurst, 16, Greenough Street, Wigan.

23 h.p. Kerry, F.N. carburetter, low, 26in. wheels, Clincher A Won, new on back, trembler coil, 20 amp. accumulators, lamp, toolbag, spares, registration, enamelling, and plating perfect, fast and reliable; £11 10s.—10, Barley Wood Road, Darnall, Sheffield.

LIVERPOOL (Rex Agency).—Before buying your new mount come and have a look at our machines. The largest stock of new and second-hand machines for fifty miles round; anything taken in part payment.—F. C. Jones and Co., 3, Redcross Street, Liverpool.

BOOTH'S SPICY OFFERS

SIX 2½ h.p. REX FEATHERWEIGHTS, 1908 models, nearly new, probably run 200 miles, low built, high tension magnetos, climb hills as good as some 3½ h.p. models, £19 19 0 each, or exchange.

FIVE NEW TWIN ANTOINES, 5½ h.p., 1908 models, low built, 2½in. tyres, latest handle-bar control, smart and powerful machines, suitable for sidecar work, going at a second-hand price, £25 0 0 each, or exchange.

FOUR 5½ h.p. REX-DE-LUXE, 1907 models, fitted with magnetos, Roe clutch, twin tyres, spring forks, spring seats, cost £50 0 0, ideal sidecar machines, handle starting, £27 10 0 each, or exchange.

THREE 3½ h.p. REXES, 1907 models, spring forks, low built, good tyres; good hill-climbers and smart-looking machines, £16 16 0 each, or exchange.

SIX 5 h.p. TWIN REXES, beautiful machines, fitted with spring forks, low built, 26in. wheels, will take a sidecar anywhere, £17 17 0 each, or exchange.

SEVEN 1906 3½ h.p. REXES, low built, spring forks, 26in. wheels, Longuemore carburettors, climbs steep hills, very reliable, £15 15 0 each, or exchange.

EIGHT 3½ h.p. REXES, very low built, both feet can be placed on the ground while seated in the saddle, 26in. wheels, Longuemores, £11 11 0 each, or exchange.

OTHER RICH BARGAINS.
 6 h.p. Twin REX, 1907, magneto £19 19
 5 h.p. Twin VINDEC, 1907, magneto 29 10
 4½ h.p. Twin MINERVA, magneto 25 0
 4½ h.p. Twin MINERVA, spring forks 19 19
 5 h.p. Twin G.B., magneto 25 0
 6 h.p. Twin REX and sidecar 22 0
 6 h.p. Twin PHANOMEN, 1908, new month ago, Nala two-speed, magneto, spring forks, fan cooled, only been 200 miles, cost £66 42 10
 3½ h.p. TRIUMPH, 1907 32 10
 4 h.p. ROC, magneto, free engine 25 0
 4 h.p. ADTOINE, magneto, two speeds .. 20 10
 Four-cylinder F.N., magneto 19 19
 3½ h.p. ARIEL, M.O.V., low 14 14
 4 h.p. ADTOINE, M.O.V., low 14 14

LIGHTWEIGHTS.

STANLEY DERMATINE,**The Motor Belt of Merit,****HOLDS ALL RECORDS.****London to Edinburgh.****Land's End to John-o'-Groat's.****London to Land's End and back.****London to Plymouth and back.****71 GOLD MEDALS.****British Made. Beware of Imitations.**

Read testimonials from End to End riders:

"Woolwich, July 22nd, 1908.

"STANLEY DERMATINE MOTOR BELT CO.

"Dear Sir,—I write to inform you of the perfect satisfaction I obtained from your belt in the Land's End to John-o'-Groat's Trial. One belt only carried me from End to End, and to all appearance is in as perfect condition as new. Under the dreadful weather conditions experienced on this ride, it proves your belt, in my experience, a perfect production.

Yours faithfully,

"J. E. TASSELL."

"Birmingham.

"Dear Sir,—The belt behaved splendidly. I only had to take it up once during the trial (End to End), and it is still in grand condition. I had no trouble with it in the wet.

Yours faithfully,

"F. C. MUSTARD."

"Sheffield, July 24th, 1908.

"TO THE STANLEY WEBB CO.

"Gentlemen,—I used the belt you supplied me with in the End to End, and found it most satisfactory. I had no trouble whatever with it, and only had to take it up twice during the three days' heavy rain. I was not troubled in the slightest with it slipping.

Yours truly, F. DOVER."

"London, W.

"Dear Mr. Webb,—Thanks for sending me one of your new extra hook-fasteners to Warrington. I found it just the thing for Berridale. I simply slipped out the extra hook, and saved about ten minutes. Again thanking you,

I am, yours sincerely,

"GORDON GIBSON."

10-12 h.p. Humber, screen, hood, five lamps, Stepney; new condition; £215; take nearly new Triumph 1908 bicycle in part payment.—Dowling, Cressington Park, Liverpool.

BARGAINS; owner giving up; offer wanted for one or lot: 12 h.p. Darracq £75; 5½ h.p. Baby Peugeot, £55; water-cooled tri. free engine, £25; 3 h.p. De Dion cycle £14.—Woodcock, 3, South Terrace, Boston.

7 h.p. Fafnir, three speeds, reverse, two bucket seats, Clincher tyres, in perfect order, quite modern, very quiet, splendid hill-climber, fitted with hood, suit doctor £45; any trial; photo.—61, Byron Street, Derby.

FINE Opportunity.—Pope Tribune, side entrance, 14 h.p., splendid hill-climber, seats four or five, showroom soiled only cash, exchange tricar or cycle, or extended payments arranged; also new chassis same make.—The Service Co., 292, High Holborn.

4½ h.p. De Dion, a grand specimen of the simple cars, 1904 make, two or four-seater, detachable tonneau, bonnet, tyre grand, 50 miles trial four up, absolute perfect condition, quiet and up-to-date, four lamps, tools, etc.; photo; £45.—61, Denmark Hill, Camberwell, S.E.

CLEMENT, 9-11 h.p., two-cylinder car, tonneau body by Rothschild, four seats, roomy and comfortable, excellent condition and splendid running order; new gear commutator, etc.; all necessary spare lamps, tools, etc.; sacrifice, £70; trial willingly.—Motor, 21, Regent's Parade, North Finchley, N.

8 h.p. Phoenix Car, two-seater, twin-cylinder, Goodrich non-skid tyres to a wheels, Cape hood, Stepney wheel, spare tyre, four lamps, all accessories; new less than three months ago; cost over £170; price £120, a bargain; good motor cycle taken in part exchange. — Bridge Garage, Briggate, Leeds.

In answering any of these advertisements it is desirable that you mention "The Motor Cycle."

EXCHANGE.

HANGE, 3 h.p. M.M.C. Motor Cycle, fast, powerful, two good cycles wanted, etc.; offers.—Bert, 2, Bushey Road, Wotton, Middlesex.

HANGE, w.c. Chater-Lea Tricar, twin seats, motor cycle, diamond ring, or gold part payment, or sell £35.—Walters, Bramant Road, Derby.

HANGE 1½ h.p. Matchless, in good going order, and cash, for higher.—Letters, Lynton Clemow, 64, Gran Park, Blackheath, London.

HANGE, 3 h.p. Triumph, in perfect order, and spares, for higher power, Fafnir, or Minerva wanted for side-Motorist, 53, Highgate Hill, N.

ER'S Motor Tricycle, 2½ h.p., magneto, splendid condition, exchange for first-class cycles (lady and gent's) and or sell £10.—Ferguson, Gipprock, Glasgow.

p. Clement-Garrard Tricar, water-cooled, three speeds and free engine, order, spares; cost £100; exchange light motor cycle.—C., 62, High Street.

HANGE, for good push cycle and £2 cash, 3½ h.p. Humber, absolutely perfect condition, engine and tyres like new; bargain.—Motorist, 9, French Place, Litch, London.

HANGE, for good motor cycle or tricar, new high-class furniture, any description, valued wholesale; direct from works. Furniture Manufacturer, 7-11, French Shoreditch, London.

HANGE, Gent's absolutely new three-speed green enamelled cycle, inverted, every refinement, and cash adjustment for modern motor cycle; no rubbish. rd, Dinnington, Rotherham.

HANGE Gent's Cycle, three speeds, new this year, cost £13, also lady's cycle, new, and double-barrelled gun, 12 bore, condition, for Tricar or Small Car. l, 16, Minster Street, Reading, Berks.

R-SEATER Brown Car, 8-10 h.p., two cylinders, three speeds and reverse, ry wheels, three tyres new (grooved p), one Continental, green leather up-ry, complete with tools, horn, three splendid condition, bargain, £55; or entertain exchange for good spring r spring frame motor cycle and cash nce.—J. Cherry, "Clovelly," Etching-Park Road, Church End, Finchley.

WANTED.

NTED, Trailer, 2in. tyres preferred; cheap for cash.—Dallaway, Cape, wick.

NTED, cylinder and piston for 3½ h.p. Rex.—Steer, 39, Napier Avenue, South-Sea.

MPH, 1907 or 1908; send full particulars, spares, etc.—Parry, Watgate Chester.

NTED, Bozier or Dupont two-speed gear, cheap, for Dion Quad.—Westfield, Essex.

TER-COOLED Head for 2½ h.p. De Dion, cheap.—Stuart Shaw, 2, Cholmeley Highgate.

NTED, Cylinder for 4 h.p. air-cooled Antoine engine.—Brown, Abbey Park, rmline, N.B.

NTED, good Sidecar; will give gent's 10-guinea pedal cycle, new.—Farrar, e Road, Halifax.

NTED, excellent Sidecar, rigid frame, 26in. castor wheel preferred; also good 21, Ritherdon Road, Balham.

NTED, good 3½ h.p. Motor Cycle, magneto, spring forks, cheap for cash.—vant, 28, Gosford Road, Beccles.

NTED, good Air-cooled Engine; will exchange New Hudson cycle, as new. 604, The Motor Cycle Offices, Coventry.

. Rover or De Dion Car; give 3½ h.p. White and Poppe motor cycle, value and £30 cash.—Box 606, The Motor Cycle, Coventry.

NTED, 1907 Triumph, magneto; exchange 2½ h.p. F.N. motor cycle, push cycle, and cash.—Storey, Bridge, Cambridge.

AT LAST. The "R.O.M." Patent Front Wheel Stand.

Facilitates mending punctures in front tyre, and if necessary the whole wheel can be easily removed when "R.O.M." stand is used.

Stand, out of position.

(Note "R.O.M." patent ball ends; by this means the machine can be easily moved in any direction in the garage, even with front wheel out.)

This stand is automatically locked when out of position, and cannot shake down. By means of the "R.O.M." patent eccentric action, the legs come close in to the mudguard when out of action, and yet spread well out when in use, thus securing an absolutely rigid support for the machine.

Price 14/6 per pair.
Illustrated list free. Prompt deliveries.

10/- FOR YOUR OLD COVER.

WANTED.

WANTED, Tricar; front seat light and roomy. — Leverett, 9, Goswell Road, E.C.

REASONABLE Cash Price given for high-class motor cycles.—Booth, Wade Street, Halifax.

WANTED, motor cycle; exchange good cycle, cash. — 1a, Frideswide Place, Kentish Town.

BOOTH Wants Drummond or other good lathe.—Booth's Motor Exchange, Wade Street, Halifax.

WANTED, good magneto machine, any pair; low tension wire, 3½d. yard; high, Pettyt, dentist, Halifax.

WANTED, Phelon and Moore or Anglian two-speed gear, chain drive.—Sutcliffe, 8, Cobden Street, Poplar, E.

TRIUMPHS wanted, 1907 or 1908, for spare cash.—Rey, 5, Heath Street, Hampstead.

SIDECAR or Forecar wanted, in exchange for oak bureau, handsome design.—23, Arden Road, Handsworth.

WANTED, four-cylinder F.N., any condition; must be cheap for cash. — 5, Heath Street, Hampstead.

WANTED, 3½ h.p. Magneto Motor Cycle, low, and accessories, N.S.U. preferred. — 56, King's Bench Street, Hull.

WANTED, Triumph Motor Cycle for cash. — Milbourn, c/o Colebarn and Sons, Cherry Lane, Walton, Liverpool.

WANTED, Round Contact Breaker, 2½ h.p. Clarendon engine, also silencer. — Aitken, Morpeth, Northumberland.

WANTED, good Motor Cycle, in exchange for a gent's and lady's new cycles, value £17.—20, Hastings Place, Bradford.

WANTED, Good Sidecar (fit Triumph), exchange Watson 12 by 1 Prism binoculars, value £6 10s.—36, Carter Street, Walworth, S.E.

SIDECARS, any number, give new gent's cycles, Sturmey-Archer three-speed gears, level exchange.—Booth, Wade Street, Halifax.

WANTED, First-class make motor cycle, 1907-8, for cash, or exchange stamp collection, value £40.—6, Cromwell Street, Ipswich.

WANTED, Tricar or Motor Cycle, exchange good piano, or sell £22, a bargain. — c/o 140, Manchester Road, Cubitt Town, Poplar.

1½ h.p. F.N. Engines with outside flywheel; condition no object; must be cheap.—and particulars to Stuart Shaw, 2, Cholmeley Villas, Highgate.

GOOD Single-cylinder for very powerful twin Rex, guaranteed. Give cash adjustment for up-to-date magneto machine.—Box 619, The Motor Cycle Offices, Coventry.

WANTED, Motor Cycle in part exchange for 8-10 h.p. four-seater Motor Car (see advert. Exchange Column). — J. Cherry, "Clovelly," Etchingham Park Road, Finchley.

STRONG Wide Trailer, axle and hubs, complete; also forecar, front axle, with wheel steering, complete, must be heavy pattern, and perfect. — Harding, Engineer, Fairford, Gloucestershire.

WILL give £10 to £20 and 3½ h.p. Twin Clement-Gerrard, low Chater-Lea frame, good order, for good Tricar or small Two-seater Car. — W. Hayman, Rhodesia, Clifton Crescent, Folkestone.

WANTED, good Motor Cycle or Tricar; exchange new high-class Furniture, any description, valued wholesale, direct from works.—Furniture Manufacturer, 7-11, French Place, Shoreditch, London.

THE Proprietors of the patent rights of R.O.M. synchronised contact breakers are prepared to accept offers for the rights to manufacture in France; write for particulars.—Continental Motor Co., 32, Rosebery Avenue, E.C.

WANTED, 6 h.p. Water-cooled Engine, genuine De Dion preferred; also two-speed and reverse gear, epicyclic, exchange 3½ h.p. De Dion, nearly new, Michelin tyres (8½ by 90), accessories, or motor bodywork. — Apply, Box 602, The Motor Cycle Offices, Coventry.

WANTED.

WANTED, cylinder head for 2 h.p. Minerva engine, a.o.v.v., 26 by 2½ rubber studded cover. — 26, Caunce Street, Blackpool.

WANTED, 3 or 3½ h.p. engine to clip on frame; cash, or exchange cycles of phonograph records. — Robinson, Buckden Hunts.

WANTED for cash, motor cycle accessories, and spares large or small quantities. — Carey's, Elephant Road London, S.E.

WANTED, Triumph, 3½ h.p., magneto for small lathe gap, slide rest, back gear, tools, and cash. — Perkins, Jessmond Bene Wycliffe Road, Northampton.

WANTED, Powerful Tricar, sound condition, part exchange handsome oak inlaid bedroom suite. — Box L3 102, The Motor Cycle Offices, 20, Tudor Street, E.C.

WANTED, very light Motor Cycle, 20in. frame, 24in. wheels, in good going order; cheap for cash; free engine preferred. — 6, Albert Road, Blackpool.

MOTOR Cycle, in exchange for Chater-Lea Ladyback tandem, nearly new, Dursley-Pedersen three-speeds, Palmer tyres, or sell cash. — 9, Church Hill, Walthamstow.

WANTED, Motor Cycle, any condition, in exchange for Ariel (gent's) high-grade cycle, perfect order and condition. — Mechanic, 54, Chaucer Road, Herne Hill, S.E.

WANTED, pair of tricar hubs and axle, also back hub and axle, cheap for cash; or will exchange 2½ h.p. petrol engine. — J. P. Sutherland, Sound, Lerwick, Shetland.

WANTED, powerful cycle, four-cylinder F.N., or good twin cycle preferred; must be cheap; long bars, spring forks, tyres good. — Ralph Radclyffe, Hyde, Wareham, Dorset.

WANTED, 6-7 h.p. twin V engine and carburetter, in exchange for splendid pedigree bull bitch (12 months), valued £15, slight repairs not objected to. — Particulars, F. D., 79, Idsworth Road, Pitsmoor, Sheffield.

WANTED, a Two-seater Car, in exchange for a 3½ h.p. motor cycle, Bat engine, latest, low built, magneto, fast, powerful, reliable, accessories, built two months ago, or sell £25; also give new dynamo, 1908 3½ h.p. Minerva engine. — Zenith, 20, Earlswood Street, East Greenwich.

Is the Tricar Dead?

MANY motor cyclists will answer this question in the affirmative, but those who look a little further ahead, and do not always judge conditions by the immediate present, may be inclined to think that there is still a promising future for this type of vehicle. Reference to our correspondence pages this week will show that one motor cyclist at any rate has noticed during a tour on the North Road quite an effervescence of tricars—many more than one would be led to expect. Thirty tricars, eighteen sidecars, and forty-one motor bicycles seen in the course of a short tour certainly calls for comment.

Whatever prejudice there may be against this type of passenger motor cycle, we can only say from our own experience that within the last few weeks we have owned and driven a special tricar which we think would sell in fairly large numbers if it was placed on the market at a reasonable price. The machine in question is quite a reversion to the old or first type of fore-carriage, with up-to-date improvements in frame, engine, and gear. There is nothing luxurious or superfluous about it, and its total weight is only about 3 cwts. It has what the early forecars never possessed, viz., a good two-speed gear and clutch, and is driven by means of a belt sufficiently wide to transmit the power of the engine without undue slipping. The early forms of light tricars had narrow belts, no two-speed gear, and in many instances were discarded because of the trouble in starting and hill-climbing. A few weeks' use of the new machine, which we hope to describe and illustrate very shortly, has convinced us that it is possible with a properly-designed $3\frac{1}{2}$ h.p. air-cooled engine and two-speed gear to propel a combined weight of about 6 cwts. in fairly undulating country without the least trouble.

The average speed does not exceed the legal limit, the frame is rigid with both seats sprung, yet the machine is extremely comfortable on fairly good roads. In our opinion this is the type of passenger motor cycle which motor cyclists who do not yearn for speed are inclined to buy.

Conversing the other day with the maker of one of the very latest forms of tricar, which has gained innumerable awards in open competition, we were informed, upon describing to him the type of vehicle in our possession, that in his opinion this was on the right lines, and that possibly within the next year or eighteen months we should see the light form of tricar with air-cooled engine return to popular favour.

What can be done with an Air-cooled Engine.

WE must say that at first we were rather timid of the air-cooled engine when running on the low gear, but although it is not equal in power to a similar sized engine with a water-cooled jacket when run for any length of time on the low gear, it is astonishing what can be done, provided the engine is suitably constructed and designed for the purpose.

There is one all-important feature in connection with an air-cooled engine which in the old days, with few exceptions, was overlooked, and that is the ratio of compression employed for different purposes. Air-cooled engines have also been improved out of all knowledge since the days when the light form of tricar became unpopular. It is therefore not surprising to find that it is possible to obtain a great amount of pleasure at a small cost from a vehicle which, with passengers,

weighs less than the majority of small cars when unladen.

A machine of this description, however, must retain its lightness and simplicity. The moment the buyer begins to yearn for car luxuries in the way of seating, luggage capacity, wind screens, and hoods, the utility and advantages of its lightness and handiness are lost. Such additions entail a corresponding increase in power with added weight to frame, engine, and tyres, until it is not only almost as expensive to maintain as a small car, but has only one greater advantage, viz., increased speed.

Speaking as enthusiastic motor cyclists, we know that there would be a very ready sale for a vehicle of this description, provided it could be sold at a reasonable price. It will not climb all the danger-board hills in the country; a gradient of 1 in 8-9 with both passengers seated is about its limit in this respect, but as hills in excess of this can be avoided in nine cases out of ten,

and the odd one climbed with the aid of the low-speed gear with the driver only up, this should be no very great hardship. A dismount might not occur more than once in a whole year's riding.

To men who want a sporting vehicle which will climb anything at high speed and exceed the speed of most cars under 30 h.p., the small air-cooled tricar will not and does not appeal, but there are hundreds of riders who wish to take a passenger on their rides, and prefer a self-contained vehicle to a sidecar and bicycle. That is why the air-cooled light tricar will come into popular favour again before very long. It is the advent of the reliable two-speed gear and clutch, all contained in the back wheel, and the reliable magneto machine, which have rendered such a machine possible. Such a vehicle in the hands of a careful and considerate man of moderate ambitions is a pleasure to own and drive, and we can quite believe that there will be a fair demand for it.

The famous horseshoe bend between Kirk Michael and St. Germain's, Isle of Man. This bend will have to be negotiated several times by the competitors in the Motor Cycle Tourist Trophy Race on the 22nd inst.

A NEW TERMINAL.

An ebonite terminal which largely differs in style from previous patterns is the one illustrated herewith, made by the makers of the Oleo sparking plug, Messrs. Ripault and Co., 64a, Poland Street, Oxford Street, W. It is designed to combine bulk of insulation and terminal connection with lightness in weight. The ebonite knob or insulator is drilled at right angles for the cable conveying the current to the sparking plug, or from the battery terminal as the case may be. The hole up the base is tapped, and in it is screwed an adapter, which is intended to push on to the top of the sparking plug, or it may be tapped to screw on to a terminal. The hole for the cable is recessed so as to form a substantial support for the wire lead, and prevent it being broken from vibration. On motor cycles

where there is sufficient room between the sparking plug and tank, or other parts of the machine, it is eminently

suitable, as it is impossible for a short circuit to take place with such a large amount of insulation.

My Record Ride

By Arthur W. Bentley.

BY the time this article appears in print I know full well that the Land's End to John-o'-Groat's record may rest in other hands, and, indeed, I almost hope that this may be the case, as I am very anxious to have another run over this course with all my arrangements properly made. It was only utter exhaustion and fatigue, due to twenty-five hours without any proper nourishment, and the misery of a night spent endeavouring to find the way along an unknown road, that caused me to lose precious time during the last stages of my ride.

Some people say that these fast long distance runs are injurious to motor cycling, inasmuch as twenty miles per hour is almost continuously exceeded.

I must decline to agree, and for these main reasons: as everybody who has travelled in these parts knows, the road for the greater part of its length is singularly quiet and deserted, notably from John-o'-Groat's to Perth. Consequently one may drive at high speed the whole time without fear of annoying any living beings other than the black faced mountain sheep, hares, and rabbits that scamper up the mountain side immediately the purr of an engine is heard. And then, again, it must be borne in mind that a great deal of the ride is carried out during the night and early morning, when, of course, there is nobody on the road at all.

Lastly, if the rider has not the common decency to study the feelings of his fellow creatures, he will at any rate for the sake of avoiding a smash drive carefully through towns and populous places.

Preparatory Arrangements.

In order to make a success of a run such as the End-to-End it is absolutely necessary that arrangements be carefully and properly made and everything cut and dried some weeks before you are due to start. This is a lesson I have learnt by most bitter and painful experience, and I shall not readily forget it. After sundry and manifold calculations as to routes, times, pilots, feeding arrangements, and suchlike details, I managed to land myself within a week of my ride absolutely and completely at sea, and with everything in most complete and absolute chaos.

The last week before actually starting I think our gardener lost nearly a stone in weight, owing to the frequent excursions he made to the post office in order to despatch telegrams, and I believe that I personally have shortened my life by some years, owing to dire anxiety and most distressing perplexity.

On the Friday evening before Whitsuntide, however,

feeling and looking somewhat limp and woebegone after my exertions, I caught the night train up North, with my machine safely packed in a crate at the end of the train, and with a large assortment of literature and provender in my travelling bag. I had decided to start from John-o'-Groat's and work southwards.

Have you, dear reader, ever made that journey up to Wick? If you have you will condole with me; if you have not you will take my advice—never to think about it under any circumstances.

Luckily, Mr. D. K. Hall, who had kindly consented to act as timekeeper, is one of the very best companions on a long journey, and he managed to liven the weary hours with stories of some of the famous rides in which he has taken part.

Well, we did arrive at last, and with all due reverence we superintended the hoisting of my machine on to a handcart and its conveyance to Mr. Robertson's garage, which had been kindly placed at our disposal for the night.

After writing a final batch of letters and dispatching the last complement of telegrams we composed our minds to rest, and were soon sleeping the sleep of the just in the station hotel, which we had fixed upon as our headquarters for the night.

Sunday morning was typically Scotch; by this I mean a steady misty drizzle did its best to drain our spirits for the whole of the day, and, failing in this, it decided to show us what a beautiful evening it could provide for us if it really cared to do so.

At about six o'clock, we decided to start on the journey to John-o'-Groat's, I on my bicycle and Mr. Hall on the front seat of Mr. Robinson's car, which was kindly driven over with a full complement of passengers.

The roads were very greasy after the rain, but as both my wheels were fitted with rubber studded covers, I did not trouble much about skidding, and in a very few minutes we were standing outside the "John-o'-Groat's Hotel," the most northerly point in Scotland, and the scene of many a famous start and finish in days gone by, and I hope in days to come.

At the Starting Point.

After we had done justice to a very substantial high tea, we went for a short stroll along the beach, and after taking several snapshots, the time being 9.30, but still quite light, Mr. Robertson bade us good-bye, and we were left to possess our souls in patience for the ensuing twenty-seven hours or so, and to pray that the good weather we were now enjoying would hold for the next few days.

My Record Ride.—

We were gladdened on Monday morning by the sun streaming into our bedroom windows, and a clear cloudless sky overhead promising well for the run south. After breakfast we repaired to the garage, which is situate a short distance down the road, to place the numerous spares I was carrying snugly and safely in the saddle bags, and to carefully tighten up nuts and see that everything was in order.

This did not take long, and before eleven o'clock I was again in bed, in order to rest, as I knew that the next two days would be full of hard work, and that I should have need of all my superfluous strength and energy to successfully cope with the numerous hardships that inevitably crop up on a long run against time. Unfortunately for me, they were building an iron house immediately beneath my window, and although I tried bribery and corruption in a vain endeavour to stop the noise, I could not overcome the conscientious scruples of the Scotsmen, who, anxious as they were to please, were none the less anxious to finish their work, and sleep being out of the question, I made the best of a bad job, and spent the remainder of the day reading "The Scarlet Pimpernel" and about fifteen telegrams that arrived at intervals from Huna. I am afraid the poor old fellow who acts as postman up at Huna will not readily forget me. I think he made that journey—about one and a half miles each way—about eight times during the day.

The Weather Prospects Good.

At intervals during the day Mr. Hall kindly brought in the latest reports as to the weather, and from him I gathered that my journey South would not be disastrous, from a weather point of view at any rate.

At nine o'clock (four hours before I had arranged to start) I could stay in bed no longer, and, donning my motor cycle garb, I went down to the garage, which, however, I found heavily padlocked.

On enquiring indoors as to the reason of this, I learnt that a chauffeur had stored a car there during the night, and had carefully locked the doors and forgotten to return the keys, which were now probably a hundred miles away.

They say that "love laughs at locksmiths," and, although I cannot answer as to the truth of this from personal experience, I can only say that we did. There are plenty of heavy stones up at John-o'-Groat's, and we found them excellent hammers for breaking padlocks.

By the time I had finished strapping on the last impedimenta Mr. Hall arrived on the scene with seals and copper wire, as I had particularly asked him to see to this, so that nobody could accuse me of riding more than one machine during the run.

Not only did Mr. Hall seal the frame of my machine, but he also sealed the cylinder of the engine, and these seals are still intact.

Reflections Before the Record Attempt.

Leaving the garage, I went for a short stroll along the beach, so as to waken up a good appetite for dinner, which I had ordered for eleven o'clock.

The day had been rather windy, and a few showers of rain had fallen; but the evening, though somewhat cloudy, was absolutely quiet and calm, with scarcely a breath of wind to disturb the unruffled face of the waters, and even as late as this the sun was bright in the heavens. Walking alone with no human being in sight and no noise save the occasional cry of some cormorant or seagull as it lazily flew away to its home across there in the Orkneys, the setting sun shining out across the North Sea likening it to a vast lake of gold, the small islands of the Orkneys indiscriminately dotted about, their dark, gaunt, rugged coastlines sending great shadows stretching far out into the water, the small white cottages of the fishermen standing out in bold relief against the dark background, and far out at sea the lighthouses dreamily flashing their lights round and round in one vast circle, and here and there some small fishing smack gently drifting back to the well-known port, the failing wind scarcely filling the sails, it is small wonder that in contemplating this most perfect scene I quite forgot for a few minutes the mission that had brought me to this quiet spot.

Slowly, very slowly, the sun sank, the shadows gradually lengthened, and I was left alone to reflect upon the wondrous works of Nature and to let its beauty and grandeur sink deep into my mind.

It was almost with a start that I looked at my watch and saw how late it was, and, hurrying back to the hotel, I found Mr. Hall and Mr. Robertson (who had kindly consented to pilot me down to Beaulieu) already seated at the table and dinner waiting. As this was the last sit-down dinner I expected to have for about two days I need hardly say that I did full justice to the really first-class fare they had without a murmur prepared for us at this late hour.

We rose from the table at 12.30 and sallied forth into the night, and having lit the lamps, proceeded to warm up the engine. My dear little machine fired with the first stroke of the pedals, and I placed full trust in it for the most severe and trying test to which a motor bicycle can be put.

Given the Word "Go" at 1 a.m.

At ten minutes to one I was at the door of the hotel anxiously waiting for the start as the minutes slowly passed by: 12.56, 57, 58, 59—I flooded the carburette, buttoned my coat well up, as the night was cold, and adjusted my goggles—15 seconds, 10, 5, 3, 2, "Go. Good-bye and good luck to you." The word rang in my ears as I turned the corner by the garage and my engine settled down to a steady hum.

Mr. Robertson had started a couple of minutes ahead of me, and upon him I was relying to pilot me down over the first 130 miles to Beaulieu; but luck was against us. First of all his lamp crashed into the road, and he continued for some distance without one, and then his back tyre gave out, and I was perforce left to find my way as best I could.

Somehow or other the news had got abroad that an attempt was being made on record, and I was much surprised at the enthusiasm and keenness that prevailed amongst these hardy Scotch sportsmen.

(To be continued.)

A practice start from John-o'-Groat's House.

Standard Machines in Hill-climbs.

By B. H. DAVIES. (Continued from page 661.)

Following upon what I said last week, another remedy for the evil occurs to me. There is obviously no earthly objection to the universal production of a special racing and hill-climbing model by all the big makers. The unsportsmanlike aspect of the present state of things is the amount of deceit employed.

The average amateur, possessed of a standard tourist model with a standard engine, is bamboozled in two distinct ways. He is first of all bamboozled into dreaming that if he enters his machine for a hill-climb, and manages by careful tuning to extract the last ounce of kick from the engine, he has a fair sporting chance to put up fastest time; whereas, as a matter of fact, he has not the faintest chance of doing anything of the sort in an open climb, and the promoting club who invite him to pay for the privilege of competing against other "standard tourist machines" have no right to accept his entry; it is akin, in my opinion, to obtaining money under false pretences.

All he can do is to get up at all.

Secondly, he is being bamboozled again, without taking competition work into consideration at all. He reads that a certain dashing trade rider has driven what professes to be an exact counterpart of his own machine up some famous "pimple" at forty miles an hour. When he visits the aforesaid famous pimple, he finds it is all he can do to get up at all, and there is no thrilling sensation of speed about *his* performance. So he is distressed in spirit, and down come his engine, magneto, and carburetter, till he has quite robbed his unlucky machine of whatever power it originally had. All because he wants to make a touring mount capable of racing achievements.

Every clubman knows that three or four firms, at the very least, build special machines—the fact is only half a secret in the clubs, though often a complete secret to the rider who is not in a club. Now, I think the Vindec people have shown us a way out of the difficulty. They built a special light model for the first T.T. Race. They made no secret of the fact; they neither shaped nor coloured it to figure as a disguised duplicate of their standard roadster, and they quote it in their ordinary catalogue. Two other firms, who utilise special machines in much of their competition work, make the matter a half-secret. They suppress all details from their catalogue, but if you happen to know about them, and go to their works and ask them to take an order for a special machine, similar to their trade riders' mounts, they will comply. Thus there are

a lot of amateurs who possess these special machines.

Now if the disqualifying engineer I suggested as an extra official at hill-climbs could be trusted to prevent entries of yet a third model from any firm, the difficulty would be well met if existing special machines were brought out in open daylight—if they figured in every makers' catalogue as what they are, if they were sold in the open market, and entered and ridden in hill-climbs under their proper name. One immediate result would be a large increase of hill-climb entries. Amateurs who suspect the genuineness of the "sport" would pluck up courage to enter strictly standard machines if they could trust promoting clubs to allow only strictly standard opposition. In each class of engine power, we should then have two classes—one for standard tourists and one for special racers—and it is the first class which would create the best sport.

I therefore call upon the clubs to either bar special machines from their hill-climbing competitions or else to create a special class for them. And I call upon the A.C.U. to refuse to issue one single permit more for any hill-climb, or to hold one itself, to be run under the present conditions.

A map of the course for the Tourist Trophy Motor Cycle Race in the Isle of Man. Competitors start from St. John's and ride to Ballacraine, up Creg Willey's Hill and down the other side to Kirk Michael; then along the coast road to Peel and back to St. John's. A contour section of the route appears on page 690.

THE SCOTT TWO-STROKE MOTOR BICYCLE.

Described by its Designer, Mr. A. A. SCOTT.

THE most noticeable feature of this motor bicycle, which competed at Sutton Bank, Newnham, and other hill-climbs recently, is the dropped frame and position of tank round the seat tube. Any striking departure from standard lines such as this at first sight suggests the "freak." The frame, however, on closer examination is justified in its mechanical construction, and the obvious advantage of having the petrol tank as well as the engine as low as possible is obtained in this machine by a simple stressed structure, of which the engine forms a central part, serving as a strut between the lower duplex tubing and the upper diagonal tube—a construction of such strength and rigidity that the machine may be ridden at full speed on the most treacherous surfaces without trace of side-slip.

The arrangement of spring forks permits of a front wheel brake, and the sliding motion of the movable

taken from the sprocket wheels fixed to each side of the flywheel by chains to the chain wheels on the two-speed gear, and thence by a longer chain to the rear wheel. The Ruthardt magneto, placed behind the tank, is driven at engine speed by a chain from the two-speed gearshaft.

The gear is operated by a convenient pedal, which when in a horizontal position provides a free engine, and when pressed backwards drops in the low gear, and when pressed forwards the high gear. This leaves the hands free to control the engine, which will readily start with rider seated on the saddle by giving a slight push off with the left foot, and at the same time throwing in the low gear with the right foot.

The engine is provided with abnormal cooling surfaces, which at first sight give the appearance of complication, but there is a noticeable absence of

The Scott

jacketed heads
of the cylinders
and the petrol
tank around the
seat tube.

fork in the sockets at the lower ends of the fixed fork is taken by rollers, so that the action is free under all conditions and unaffected by mud and wet. The compression and recoil springs are also protected by plated tubular casings.

The footboards, which extend in a gradual curve forward and aft, are also mounted on a system of compression springs. The additional comfort of roomy spring-supported footboards is appreciated on a long run, where a change of position for the feet does much to reduce fatigue. The footboards are also arranged in a gradual curve, so that the natural posture of the feet is retained in all positions without bending or extension of the ankle.

The Engine Details.

The two-stroke engine is a twin-cylinder (58 by 40 mm. each), with separate crank cases, the interiors of which can be inspected by slackening a winged nut and removing a cover plate. A proportionately large flywheel is mounted on that portion of the shaft which lies between the crankcases, and the drive is

transmitted by piping, which is generally so conspicuous on a "twin." The water-cooled head is directly connected with the radiator and supply tank, fixed to the lower duplex tubing of the frame. The radiator consists of flat copper tubes, with interposed distance rings bolted together, forming a mechanically held system independent of soldered joints. Natural circulation is relied upon.

A Reduced Number of Parts.

The working parts of the two-stroke engine are simply piston, connecting rod, and crank pin in duplicate, and all of these parts are kept in constant thrust, so that slackness in any of the bearings has no effect on the quiet running of the engine. To emphasise this point: The piston, connecting rod, and crank pin are kept closely pressed together at all points of the revolutions, so that slack in the bearings can have no effect on the running of the engine beyond reducing the cylinder compression and clearance spaces. This condition of affairs obtains up to 2,500 revolutions per minute, above that speed the

The Scott Two-stroke Motor Bicycle.—

customary knock would occur, as in the ordinary four-cycle type. The connecting rod ends and main shaft are provided with a type of roller bearing similar to and occupying the same space as the ordinary ball bearing, and the shaft is off set so as to equalise the pressure caused by the angularity of the connecting rod on each side of the cylinder. The mechanical efficiency of the engine has been found to be 85%.

The exhaust ports and the ports used for conveying gas from crank cases to combustion heads can be inspected by removing the front and back covers so that the piston rings can be examined and ports cleaned if necessary without removing the cylinders.

It will be noticed that the cylinders are mounted on an aluminium casting known as the "distribution box," which contains an exhaust chamber in connection with the silencer, and also a suction chamber connected with the automatic carburetter and in communication with the inlet ports of each cylinder. The charge is drawn in and compressed in the crank cases by the displacement of the pistons, and delivered to the cylinder through the "transfer" ports in the ordinary way. Constructional details completely prevent any chance of "backfiring," and the piston is shaped in such a way as to effectively deflect the incoming charge, and at the same time minimise the surface exposed to the hot gases.

The engine is controlled on the throttle, which affects the crank case pressures only, and the cylinder compression is under all conditions the same.

The port openings and pipe areas in this engine are designed so as to permit of exceptionally high speed, and the engine is capable of running up to 3,000 revolutions per minute. The actual speed with a gear of 5 to 1 is 2,690 revolutions per minute.

No Valve Grinding.

In this engine the cylinder compression remains permanently good, due to the absence of valves, and also owing to the port system, whereby the top piston ring gets lubricated as well as the lower rings, so that there is no appreciable wear at the piston ring grooves.

It will be seen that the scope for tuning up an engine of this description is limited to the adjustment of the carburetter, which has a variable jet controlled from the handle-bar. The petrol level is normally kept nearly one inch below the mouth of the jet, and an automatic adjustable air valve is provided, which at slow speeds and at starting gives the necessary suction at the jet.

The petrol consumption averages eighty to ninety miles to the gallon, and the total weight of the engine is 37 1/4 lbs.

[This interesting machine is now made by The Jowett Motor Manufacturing Co., Grosvenor Road, Manton Lane, Bradford.—ED.]

Variable Gears as an Aid to Traffic Riding.

ZENITH MOTORS, LTD., are to be doubly congratulated in that, firstly, they thought of an excellent means of testing the efficiency of their gear in traffic, and, secondly, that they came through that test with flying colours. A few days ago Mr. W. G. Bower, the managing director of the company, telephoned through to these offices, suggesting that if one of our staff would observe him, he would drive a Zenette of standard pattern as far and as long as we liked, through the densest traffic we could find, without stopping his engine or leaving the saddle. The trial was one of a nature which had never before been attempted by a motor bicycle, so we gladly selected a route which is about the most difficult which can be found from the point of view of dense traffic, while the surface in places is about as bad as can be found anywhere in town. The route chosen was as follows: Stroud Green Road, Seven Sisters Road, Hornsey Road, Holloway Road, Old Street, Great Eastern Street, Norton Folgate, Bishopsgate Street, Liverpool Street, Old Broad Street, Bank, Queen Victoria Street, Ludgate Circus, New Bridge Street, Tudor Street, *The Motor Cycle* Offices. Here a brief rest was to be taken, and with the exception of one or two modifications the same route was to be followed back to Stroud Green Road. Throughout the trip Mr. Bower, who rode a standard 3 1/2 h.p. Zenette fitted with accumulator ignition, was closely followed by a Morris steam car, a vehicle highly suitable for such a journey, which bore our representative. The Zenette came through the arduous trial in excellent form and without becoming unduly overheated, the engine never

missed fire, and its rider never left the saddle. In the dense traffic where the explosions were inaudible to those following in the observing car, we were acquainted with the fact that the engine was firing regularly by the blue smoke issuing from the silencer, an overdose

Mr. Bower and his Zenette Motor Bicycle in the thick of the traffic at the Bank Crossing.

of lubricating oil having been inserted for the purpose. On the return journey the machine ran equally well, and anyone acquainted with the terrors of London traffic will appreciate the fact that the accomplishment of such a non-stop ride is no mean performance, while it goes to prove the comfort of a variable gear.

OCCASIONAL COMMENTS

By "IXION."

Cyclometer Fitting.

Several correspondents inform me that an ordinary pedal bicycle cyclometer will last perfectly well on a motor cycle if a special attachment be made for it; with the screws provided they jar off in a few miles. Since writing my notes upon these I have inspected a pedal bicycle cyclometer which has run for two seasons on a $3\frac{1}{2}$ h.p. Minerva, and I note that the original clip is still in use, but a much longer screw has been fitted, and after the locknut had been packed out with washers the projecting end has been riveted over with a hammer. This plan is therefore to be recommended.

Worn Bell Cranks on Magnetos.

A correspondent sends me a wrinkle for obviating the effects of wear on either the bell crank or the fibre ring of a motor cycle magneto. It runs as follows, and was obtained direct from the Bosch Co.: Unscrew the fixed platinum point, and file one-sixty-fourth part of an inch off the face of the plate into which this screw beds, so as to sink it further into its bed by that distance. This adjustment naturally increases the amount of break at the platina, but the break may be corrected by placing a very thin paper washer under the platinum screw on the bell crank. Care must be taken not to reverse this process, as a reversal of the operations will not improve the timing of the spark. I see from my files that Mr. Davies gave a similar tip some years ago. I might point out that this tip should only be followed in emergencies, as when the platina which have been adjusted in this fashion are worn out further adjustments will be needed to obtain accurate timing of the spark with a pair of new platina or a new bell crank. Fortunately, the wear on this tip is intended to deal with does not take place in a less distance than several thousand miles, so owners of comparatively new magnetos need not worry their heads about it either way.

An Appeal to the Industry.

When you write for the catalogue of the $3\frac{1}{2}$ h.p. Thunderbolt in these advanced days, you first of all peruse in its pages the specification of that magnificent machine, with the various items which cause it to stand out head and shoulders above a crowd of feebly envious rivals; then you come to an astounding list of its performances, which make it appear to you as a dog in the manger, until you have also procured the catalogue of the 5 h.p. Lightning Conductor, and discovered to your bewilderment that it also swept the board in 1907, and at last you come—and this is my point—to the accessory pages, wherein you find prices of the Thunderbolt accessories—the Thunderbolt lamp, the Thunderbolt horn, the Thunderbolt pump, the Thunderbolt stand, and so forth. When you purchase these accessories, you find in many instances that they would suit the 5 h.p. Lightning Conductor quite as well as the Thunderbolt, or possibly better; and this leads to experiences like mine of the other day.

I was riding an important journey—by night—on a $\frac{1}{2}$ h.p. Thunderbolt. I was duly fitted out with the Thunderbolt specialities, and more particularly with their Thunderbolt lamp, hooter, and separate generator. One long a screw dropped out of the Thunderbolt separate generator bracket, and it slid gently down

towards the hub of the front wheel, where it wrenched out several spokes. Having no spare screw I carried the generator in my hand for some miles, until I got enough tubing to connect it from my side pocket to the lamp. Then the Thunderbolt lamp itself—peerless illuminator though it be—jarred off the Thunderbolt bracket, and broke its Thunderbolt glass. Then the Thunderbolt hooter jarred off the Thunderbolt handle-bar, and had to be carried thenceforward tied to the Thunderbolt carrier by a piece of non-Thunderbolt string. And so on. My point is this; if a motor cycle firm lays itself out to supply accessories, why does it not go one step further, and perfect those accessories for the services they have to perform? Why is not the Thunderbolt separate generator's bracket either brazed solid with the fork before enamelling, or stamped in one piece with the Thunderbolt tankclip? Why have not both Thunderbolt lamp and Thunderbolt generator clamping screws passed right through their holders and fastened by lock-

Some of the competitors in the Manchester M.C. Two Days' Reliability Run to Cheltenham and back.

nuts? Why has not the Thunderbolt hooter a clamp which will really grip the Thunderbolt handle-bar? And so forth. It is true all this means a trifling extra expense; but it would be quickly and fully repaid to the far sighted maker. At present not one rider in ten gets his accessories from the makers of his machine, for the simple reason that with one or two noble exceptions, they will not fit his machine one atom better than any chance assortment purchased from any factor's general stock. But if we knew that by ordering accessories with the machine, we should get a set of fittings suited in outline, finish, and attachment to the machine, free from defects of appearance, free from those annoying little mischances which I have described as spoiling my night run, every single motor cyclist would take care to order his 1909 mount to be sent out from the factory fitted complete and ready for the road. And its makers would more than repay themselves for the outlay on a few bolts, screws, and special fittings by the profits on an increased sale of accessories.

Palmer Tyre, Ltd., announce that owing to increasing business they have found it necessary to transfer their cycle and motor cycle departments to more commodious premises at 103, St. John Street, Clerkenwell, London, E.C.

Letters to

the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle" 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Petrol Consumption.

[3509.]—I am much interested in Mr. A. H. Doherty's reply to "R. G. P.," page 609, *re* the G. and A. carburetter. I have made and fitted an extra air inlet to my $3\frac{1}{2}$ h.p. Minerva, which is fitted with this make of carburetter, and am now riding 100 miles to the gallon of petrol instead of eighty or eighty-five before this extra air inlet was fitted, and also with a marked gain in power.

CECIL CROWTHER.

Sidecars.

[3510.]—After the discussion in *The Motor Cycle* recently, one would have thought the different makers of sidecars would have backed up their arguments in the End-to-end trials. They evidently do not consider them fitted for the journey. I beg to give Mr. Montgomery a tip which he should place before his customers. By lifting up the links on the top and tilting the basket over the motor bicycle, the combination will pass through a narrow doorway. I have to do this every time I take out my sidecar.

PERCY.

The Judges' Report on the End-to-end.

[3511.]—I wish to correct an error in my article on the judges' report of the End-to-end. I spoke therein of the Douglas machines as being fitted with a high tension distributor and single trembler coil. As a matter of fact, they were all three fitted with Bosch magnetos. This mistake was due to my own carelessness in identifying these machines with a similar mount just examined, turned out by a different firm—a carelessness confirmed by an untrue statement just to hand from a correspondent of mine.

B. H. DAVIES.

Thirteen Stone v. Two Horse-power.

[3512.]—I read the article under the above heading by Mr. B. H. Davies in the issue of August 12th, regarding the Moto-Rêve lightweight machine. It interested me very much as I have invested in one of those marvellous little machines. Happening to be in Scotland about the middle of May, I saw one at the Edinburgh Exhibition, and after a demonstration of its various points, I purchased one, and rode it on the following day from Edinburgh to Blackpool. Although almost a complete novice, I did this journey of over 200 miles in less than eleven and a half hours, which I think is remarkably good going for a small engine like this, and quite fast enough to satisfy the average motor cyclist.

I have had no trouble at all with the engine since I received the machine; it starts easily, and very seldom have I had to help it by pedalling, as it fairly flies up any ordinary hills, but I must agree with Mr. Davies that we want wheels and tyres a little heavier. I had not used the machine more than six weeks when the belt rim spokes slackened, and one or two of them broke, also some of the spokes of the back wheel broke, with the result that the belt rim was practically hanging to the wheel. I sent the wheel back to the Edinburgh agents, and they were so good as to fit up the wheel again, rebuilding it with much heavier spokes. I got wheel back almost at once, carriage paid, without any charge, and it is now quite strong. But I think that a 2in. tyre instead of the 1 $\frac{1}{2}$ in. would be a great improvement, otherwise I could

not desire anything better, and so long as I can spin along with my 2 h.p. and climb hills as I do with ease and comfort, I am quite content to look no further than the humble
LIGHTWEIGHT.

Motor Cycle Finish.

[3513.]—I read with interest the letter [No. 3474] of Mr. H. Crole-Rees on the subject of motor cycle finish, and quite agree with him that black is really a most unsuitable colour, but I do not entirely agree with his choice of French grey. Although the grey would not show dirt it would not look really smart or clean.

I have this season painted my own motor cycle, and perhaps your many readers may be interested. The colour used was cream with fine green lines, and the result is a spick and span motor cycle, even after a long run, especially in districts where dust is white.

The great thing one must be careful about to ensure good appearance and lasting wear is to get a good enamel paint that does not set in five minutes, and has high elastic quality. This is essential.

Personally, I have used Satinette, and do not think it can be beaten, although I have tried many makes, special cycle enamels included.

It is made by Messrs. Pinchin, Johnson and Co., Ltd., Bevis Marks, London, and I would recommend all who contemplate painting their motor cycles at home to give it a trial. Dismantling to my idea is essential.
TAP.

Is the Tricar Dead?

[3514.]—I am at a loss to account for the number of tricars on the road lately. Whilst touring on the North Road during last week I counted nearly thirty tricars against eighteen sidecars and forty-one motor cycles. Is the tricar coming into vogue again, or is there a tricar club now? A number of tricars passed me one after the other, and at first I did not count them. The open frame variety were in the majority—mostly Rileys, Rexettes, and Phœnix, and I only saw one stopped for repairs (broken chain. I think).

I have been thinking of selling mine, but shall not do so until next spring if you think a boom is coming. I have had little trouble with mine, except a slipping clutch, which has righted itself now. Tricars I find are at first rather difficult to get round corners, at least to a bicyclist, but this all depends on clutch manipulation, and once you have mastered the proper use of the clutch it is quite easy.

I was stopped the other day by a policeman for not having the rear number illuminated, and he took my name and address. Your book, "Motor Cycles and How to Manage Them," says that a rear number is not required. The tricar only weighs 3 cwt., so I should be quite on the right side, I think; anyhow, I have heard nothing further at present.

I quite agree with your correspondent "Moclist" in last week's issue regarding vexatious delays, having had three months of the summer wasted through having to wait for two small parts. Wishing your splendid paper every success.

OLD HAND.

[Tricars weighing under 3 cwts. unladen, *i.e.*, minus petrol, oil, tools, etc., are not legally compelled to carry a rear red light, or to illuminate the rear number. The front number must, however, be illuminated on both sides of the plate, as on a motor bicycle.—ED.]

Adjustable Tappets.

[3515.]—The following may be of interest to those who have not adjustable tappets. The top of my tappet is about as large as a farthing, and the exhaust valve stem is barely $\frac{1}{16}$ in. diameter, the result being that a considerable hole was worn in the tappet by the valve stem. I ran a $\frac{1}{16}$ in. thread in the valve stem, and fitted a nut and lock nut. I can now adjust my exhaust lift to a nicety, and also have the large surface of the nut to strike the tappet, with consequently less wear. Also, if the nut gets worn it is not much trouble or expense to replace it.

H. H. COBB.

Protecting Magneto Terminals.

[3516.]—I feel I must emphasise the tip I read in *The Motor Cycle* on page 642, regarding the smearing of the magneto with vaseline to stop short circuiting. I am an old rider of the Twin Vindec, and the trouble mentioned was the only fault I had to find with a splendid machine. On the 23rd ult. I was compelled to take a longish ride in what proved to be one of the wettest days of the year. I started with a great fear of constant trouble with the magneto as hitherto, but I had rubbed vaseline over all the terminals as recommended, and I can thankfully say I did not have a single misfire, so I felt I must write you on the subject, as this is the first time I have thoroughly overcome the trouble.

E. P. WAGHORN.

The Muratti Trophy Reliability Trials.

[3517.]—Is a 200 guinea prize not enough to induce riders to come to Belfast? The few who turned up for the above trials only represented three makes of machines. All the competitors were Belfastians except Mr. McCann, and he deserves a special supper or medal for coming over. I found him in the centre of Belfast with no one to show him the road to the Grand Central. I trust there will in future be a much larger entry, and there should be a committee of motor cyclists formed to pilot the competitors to their stopping place and entertain them when they get there. Trusting to see a better representation next year,

ONE AND A QUARTER.

Hill-climbing in North Wales.

[3518.]—I notice in letter 3487, Mr. R. Meesom mentions that he climbed the hill on the road from Bettws-y-Coed to Chapel Garmon. He may be interested to hear that I have also climbed this hill.

I notice Mr. Meesom also mentions West Hill, Hampstead. Surely, he means Highgate, for I have lived in Hampstead practically all my life and have never heard of a West Hill there. West Hill, Highgate, is a very mild one.

Motorists looking for a real hill should try Barbrook Hill, about a mile from Lynton, on the road to Parracombe in Devon. The surface is first-class, but should not be tried in wet weather.

Mr. Meesom may be interested to know that the machine used in Wales was a $3\frac{1}{2}$ h.p. Bat, De Dion type engine, rigid frame, N.S.U. two-speed gear, with Advance adjustable pulley, combined gear 4 to 1 and $6\frac{1}{2}$ to 1, long footboards, and no pedals, weight 162 lbs. all on excepting oil and petrol. My own weight is 11 stones.

HAROLD KARSLAKE.

Formulae in Hill-climbs.

[3519.]—Might I be allowed to reply to your correspondent, Mr. W. G. Bower concerning formulae in hill-climbs. I think the Coventry Motor Club and the A.C.U. show great judgment in not having a special formula for two-cycle engines—a type which undoubtedly merits encouragement. After years of experiment and trial a man succeeds in bringing out an engine which develops more power, weight for weight, is simpler almost by half, and with two cylinders as the torque of the usual four, I should consider it the height of injustice if the governing body and leading clubs handicapped his machine to give the older fashioned type a look in.

I think Mr. Bower must have written without full thought, for an exact parallel would be the case of an engineer who improved the usual four-cycle engine very greatly by some simple contrivance, and then got no benefit because he was handicapped out of hill-climbs and power competitions from the results of which so many buyers receive guidance.

It is no use to say that the two-cycle engine has other points which condemn it, for that is not the case. Up till now, lack of power, weight for weight, has usually been its fault, for it used not to be able to run fast. Mr. Scott seems to have got over this difficulty, and I consider that every encouragement should be given in the development of a type of engine which threatens, in time at any rate, to eclipse the more usual and better known four-cycle type.

R. K. HUBBARD.

Footrests v. Pedals and Stands.

[3520.]—Mr. A. W. Wall [letter 3493] should not forget that pedalling gear in connection with a clutch or two-speed gear gives motor cyclists a convenience that car drivers hanker after very much, viz., the power to start the machine from the seat without having to dismount and "coffee grind." It is difficult to manage this on a car, but it is so easily arranged on a motor cycle that I am sure motor cyclists will insist upon it or some equivalent.

Mr. Davies's remarks *re* lamps are well founded. I suggested some time ago that the End-to-end run should be availed of for a test of lamps as well as machines, the lamps to be purchased by the judges from ordinary dealers so that there should be no question of special articles being supplied.

H. M.

[3521.]—I agree with the writer of letter 3493 *re* above with regard to not requiring pedals for assisting the machine, but do not think that the advent of the variable-gear has made it unnecessary to have pedals. What of the various gears such as the Vindec, and several others, which start the engine by turning the pedals, and are far superior in every way to handle starting? No trouble about where to carry the starting handle, or getting it out, starting the engine, putting it away again, and then getting on the

Variable Gears as an Aid to Traffic Riding. Mr. Bower on his Zenette Variably-geared Motor Bicycle, followed by the observing car. (See page 683.)

machine and letting in the clutch and all the time the engine racing and getting hot. With the Vindec gear just one push at the pedal whilst the rider is standing astride the machine and letting in the clutch. With regard to footrests, these can be fitted to any machine, but are not so good as a stand when changing a tube, particularly so on a muddy road. I prefer to have the wheel clear of the mud. As for pedals not allowing of a comfortable safe low riding position, all I have to say is that there is no difference in the height of the saddle top from the ground in my two machines—the one a 1908 twin-cylinder two-speed Vindec Special with pedals, and the other a 1908 single-cylinder two-speed Royal Roc. There is one point with regard to the Roc 1908 clutch gear on which I should like readers' experiences, and that is how to stop the clutches from slipping. The oil works out of the gearcase on to the clutch bands, and no amount of pressure on the clutch pedal will cause them to grip properly. This is the experience of three of us in this district (Liversedge).

PRACTICAL EXPERIENCE.

A Problem to be Solved.

[3522].—I have been very much interested indeed in the replies to my letter entitled "A Problem to be Solved," which was published in your magazine a short time ago. I think that perhaps you hit the nail on the head in your footnote to my letter when you stated that the oil had something to do with propulsion at the high temperatures which are present when this phenomenon takes place. I see that letter No. 3407 agrees with this, and suggests that in the abnormal state referred to my engine operated like the Diesel engine, which, as everyone knows, burns crude oil. I believe when the matter is thoroughly thrashed out it will be found that either the above is the explanation, or else the high efficiency is due to the perfect compression caused by the expansion of the pistons. One of your correspondents stated that the piston and cylinder expanded the same amount. I cannot agree with him. The piston is moving in a confined space, where it cannot radiate its heat. It is practically insulated from the cylinder wall by the film of oil surrounding it. The cylinder, on the other hand, can radiate its heat readily, and therefore is at a much lower temperature than the piston itself.

Correspondent No. 3407 asks why cannot the Diesel engine be employed on motor cycles. I believe the reason that this very excellent engine has not been used on automobiles and motor cycles is due to the fact that an unusually heavy engine is necessary in order to get any power; in other words, the weight per h.p. is abnormally high.

I hope that this matter will be thoroughly discussed in your paper, and that in the end a satisfactory explanation may be evolved.

I made one very pleasant trip to England, and met Mr. W. H. Wells, of the South British Trading Co., and several other trade riders. I had such a good time that I am planning to take in the Stanley Show this year. I meant to get to Coventry last year, but, owing to press of other matters, I failed to do so. I will not fail to make the acquaintance of *The Motor Cycle*, however, when I take my next trip. From my experience, I have nothing but praise for the English motor cyclist, for I found him to be a sportsman through and through. I look forward to coming in contact with him again.

EARLE L. OVINGTON.

New York.

Standard Machines in Hill-climbs.

[3523].—Having carefully read Mr. B. H. Davies's article upon this subject, it appears to us that it must appeal to a number of your readers that the "Messrs. So-and-So" mentioned who use ball bearing engines for hill-climbs and yet sell machines with plain bearing engines are the Rex Motor Manufacturing Co., Ltd. If this is so, Mr. Davies is quite right in stating that we do manufacture certain engines with plain bearings, and also certain engines with ball bearings, but the ball bearing engines are just as much a feature of the Rex business as the plain bearings, the only difference being that the public are charged three guineas extra for machines fitted with ball bearing engines.

As regards winning many hill-climbs, if it is the Rex Co. which is referred to, it certainly has done its share during the past few years, but we must point out that the majority of these successes have been obtained with plain bearing engines. Take the performance, for instance, of Messrs. Applebee and Godfrey. These riders have never used in competition a ball bearing engine, and bestride the same machines to-day as they rode early in 1907. On going through the list of Rex machines ridden at the Newnham Hill-climb, to which Mr. Davies refers, we think we are right in stating that at least 75% per cent. of these were fitted with the old-fashioned plain bearing engines. We should, therefore, like to wipe away any suggestion that the Rex motor cycles used in the Newnham Hill-climb were any other than standard machines, except where riders dispensed with pedals and substituted the bar footrest which gave them a non-standard appearance.

The two plain bearing machines used by Applebee and Godfrey in hill-climbs during the past two years have been through all the long distance trials, including the London to Edinburgh and back, Land's End to John-o'-Groat's, Plymouth and back, and all other performances in which their respective names have appeared.

Surely machines of this description, which are even to-day, as proved at the Newnham Hill-climb, the fastest in the twin class, cannot be accused of being other than standard touring mounts.

THE REX MOTOR MANUFACTURING CO., LTD.

"Ixon" on Lightweight Motor Cycles.

[3524].—"Ixon" admits that he may be jaundiced against the lightweight motor cycle. Confessedly, then, he is scarcely a competent critic. The whole tenor of the paragraph under "Occasional Comments" in *The Motor Cycle* of August 19th is one of thinly veiled contempt for the lightweight motor cycle. Such a paragraph is calculated to do a considerable amount of harm to a portion of the industry which we claim to have inaugurated, and we resent its publication.

While in various competitions of a strenuous character the Motosacoche has performed admirably and drawn to itself a considerable amount of unqualified praise, we wish to point out that it is not intended as a racing instrument; it is not intended to compete with heavy high-powered motors for excessively long-distance work. We wish once again to emphasise that its whole *raison d'être* is that it is a motor-assisted bicycle, a link between the ordinary push bicycle and the motor bicycle so-called.

If "Ixon" would make a journey to Geneva, the birthplace of the light detachable motor, we are sure his eyes would be opened to a state of things which does not at present exist in England. Here the detachable motor has taken the place of the ordinary push bicycle. It is used by business men in the same way they used the push bicycle before the introduction of the motor. There are no goggles, leather coats and leather breeches, big boots, leggings, and other weird get-up about the riders of Geneva; neither are their machines loaded up with huge lamps, horns, luggage carriers and luggage stands, such as seem to be the delight of the English motor cyclist. The Genevise have accepted the Motosacoche for what it is and for what it was intended—a machine to take the place of the ordinary bicycle, and which can be handled with all the ease of the ordinary bicycle.

It is most absurd and unfair to compare it with heavy touring motor cycles. "Ixon" is good enough to admit the reliability of the motor attachment itself, but condemns the bicycle and its component parts, such as belts, tyres, and rims. It is granted that these items are lighter than those employed on the high-powered motor bicycle of more than double the weight, but the weights of the bicycle and its tyres are all in conformity with the weight of the motor, and if the machine is used for the purpose for which it is intended these fitments are in every way suitable and efficient. If we are to take "Ixon" seriously we should fit a Motosacoche attachment—1½ h.p. engine and all mechanical parts, including accumulator, belt rim, belt and control weighing only 41½ lbs., with a bicycle equipment suitable for any of the heavier machines now on the market. While this is on the face of it ridiculous, the whole idea of the light, portable, runabout bicycle is at once destroyed.

In conclusion, we have yet to receive complaints of damaged rims or frames such as "Ixon" suggests is a common feature of the lightweight motor cycle. The bicycle for the Motosacoche attachment is made by the Rover Co., Coventry, which is a good enough guarantee of quality.

H. AND A. DUFAUX (ENGLAND) LTD.

["Ixon" did not refer to frames, he confined himself to belts, tyres, and rims.—Ed.]

EXPERIENCES WANTED.

"Conversion" would like to have readers' experiences regarding a Triumph motor bicycle after it has been converted to the Roc two-speed gear and clutch system.

"E. R. C." (Dover) would like readers' experiences with the 7-8 h.p. Minerva engine.

"B. A. F." would like readers' experiences with the Triumph engine; also the Jap automatic centrifugal expanding and contracting pulley.

[Several interesting letters are unavoidably held over, and will be published as space permits.]

THE MOTOR CYCLIST AND HIS AMBITION.

By Clarence Ponting.

(With apologies to Bart Kennedy.)

THE ambition of the motor cyclist. This aristocratic, enviable, over wealthy, time-killing, thirty-miles-an-hour, non-silencer, happy-go-lucky ambition of the motor cyclist. The ambition and hobby of him with the well-filled purse.

Or is it the hobby of the man with moderate means, the man with enough to support himself, the man with a little spare wealth? Which is it?

Let us see what is his ambition.

Let us sit down and minutely examine his motor. This strange conglomeration of wheels and wires, of sparking plug and magneto. The motor cyclist's pride. This thing of petrol and noise. Let us examine it I say.

The motor cyclist. He begins his education as a raw cyclist. A push bike. A thing which has to be pushed. A mere bicycle. Target for abuse. Target for contempt. Target for derision. A target for everybody.

You who have "twins," have pity on him. Have pity on this poor unfortunate push cyclist. The man who pedals. Pity him, I say, for is not the push cyclist the father of the lordly car? Yes, great as you all are, you once were cyclists. Poor push cyclists like him. Cyclists. And so, pity him.

He is now no longer a push cyclist. That time has passed. That seemingly interminable, cheerfully forgettable time has passed. Gone for ever. Never to return.

He is a cyclist no longer.

He is the owner of a one horse motor cycle. He motors. He is responsible for it's good behaviour. The motor provides his daily labour. He works at the motor, on the motor, by the motor, for the motor. His life is nothing but motors. He therefore hates his motor. He does not love his motor. He hates it. Loathes it. Detests it. He hates it with an undying and diabolical hatred. He yearns to be rid of it. Yearns to have a three-horse motor. Yearns to leave his one horse-power motor for ever, never to touch it again. Never again.

And yet he is proud of it. He is swaggeringly, blatantly, unbearably proud of it. He flaunts it in the face of the cyclist, an exemplary of the way cycling should be done. The poor, little cyclist is forced to study the machine, to examine it, to praise it. He, too, hates it. Poor push cyclist. He, too, hates it. Unhappy cyclist. And the motor cyclist laughs. Hard-hearted motor cyclist. Silly, noisy, affected, overbearing, leather-coated motorist. He cannot contain himself. Cocky motorist. Leave him alone. He'll grow out of it. Some day. Perhaps.

The ambition of the motor cyclist. Its third stage. Ah! Don't breathe of it! Don't speak of it! Stage three.

He is the owner of a "twin." A full blown owner of a "twin." A leather coated, yellow legged, swaggering owner of a "twin." The sole owner of a "twin." Paid for it out of his savings.

Sometimes he is polite, attentive, chatty, good-humoured, affable, beaming, cheery motor cyclist. That is when everything is nicely tuned up.

Other times he is peevish, petulant, irritable, fidgety, and blasphemous.

That is when it is misfiring, or he is talking to a man who owns a one horse motor.

Now everybody envies the owner of a "twin"! How they all stare at him, glare at him, envy him! Yet he obviously continues slinging money about on accessories. The glimmering, shimmering, gold and silver and copper. He calmly, contemptuously, contumaciously, continues buying the latest accessories. It's all done with money.

Money. Wonderful money.

Money. The harbinger of comfort and longevity.

Money. The herald of malice and murder.

Money. The root of all evil.

Money. The root of all good.

Money. Mere metallic money.

What does the owner of a "twin" care for money?

What does he, the owner of a twin, care for money?

In spite of being able to purchase the latest thing in sparking plugs, the owner of a "twin" is not contented. He is not a contented man. He is a discontented man. This owner of a "twin." His life is one of hopes and fears. Big speeds and excessive fines. Police traps and punctured tyres.

When he owned a one horse-power he thought he would never be able to afford a "twin," and now that he has a "twin" and able to level all hills, he is not satisfied. He is a dissatisfied and discontented owner of a "twin." Only the owner of a "twin." Just the owner of a "twin." Nothing more. Nothing less. Just the owner of a "twin."

Let us leave him. He will be more some day. He will be the driver of a tricar. Something more than the owner of a "twin."

It's oh! to be the driver of a tricar! No belt troubles! No misfiring! No solitary rides! No anything!

The driver of a tricar.

You know everything that's worth knowing. You are a chauffeur. You are the boss of the whole contraption. You order everybody about. Nobody orders you about. The man with the 1 h.p. consults you. The repairer obeys you. They obey you, for you possess a tricar.

You have no trouble. The repairer has all that. You are not the repairer. You are the tricar driver.

If you drive well you get the credit. Good driving puts you at a premium.

If you drive badly and make mistakes the motor gets the blame. Bad results puts it at a discount.

Oh! it's nice to be the owner of a tricar. To live the comfortable life of the tricar driver. The lucky owner of a tricar. The airy driver of a tricar. The wealthy owner of a tricar. It's great to be able to possess a tricar.

We shall all have tricars. Some day. Perhaps. If we live long enough.

The ambition of the motor cyclist.

Its last stage. The owner of a car.

The owner of a car. That is the ambition of a motor cyclist.

What a vast assortment of car drivers there are! Tall drivers. Short drivers. Thin drivers. Stout drivers. Calm drivers. Angry drivers. Deep drivers. Clever drivers. Young drivers. Old

The Motor Cyclist and his Ambition.—

drivers. Bald drivers. Red-faced drivers. Voluble drivers. Silent drivers. Reckless drivers. Careful drivers. Begoggled drivers. Drivers all.

The driver is *the* man on the car. *L'ne* motorist *par excellence*.

Everybody looks to the car driver for everything.

The culminating point of a motor cyclist's career is that of a chauffeur. It is his ideal, his goal, the terminus of his ambition. The car driver. The man at the wheel. Boss over all he surveys.

Oh! It's nice to be the driver of a car. A real car

driver. Not a motor cyclist, but a car driver.

Envy him, I say. Is he not the owner of a car? We shall all own cars. Someday. If we live long enough.

And now that we have followed the motor cyclist to the culminating point of his ambition, are we any the wiser? Do we know anything more about him? About this curious, heterogeneous, self-propelled, snorting motor cyclist?

No? You say no! You say we do not! That is what you say! Then let us leave it.

Leave this ambition of the Motor Cyclist.

Let us leave it alone. For ever.

A new pattern rigid sidecar patented by J. McCullum, of Joppa, N.B. It will be noticed that the sidecar wheel is directly under the passenger's seat, the advantages claimed for this arrangement being less wear on tyres owing to the reduced width, which it is said causes less strain.

Magneto Covers and Short Circuiting.

THE letter published below was sent for our correspondence columns, but as it is one of many we have received lately from readers complaining that magneto covers now on the market are a cause of short circuits on the magneto, we addressed a letter of enquiry to the Bosch Magneto Co. on the subject, and have received their reply, which we have pleasure in publishing in conjunction with the warning sent by our correspondent, Mr. J. Butler.

"May I warn your readers against using a patent leather magneto cover, as I purchased one during the holidays and could not for the life of me make out why the machine did not fire when the cover was on, but would do so as soon as the cover was removed. The magneto was shorting somewhere, so I removed all the buckles and straps, and again put it on. This had no effect. I was informed it was the glazing on the leather attracting the current. May I ask, if this is so? The machine is a Triumph, and nothing is amiss when the cover is discarded. But, oh! what a hot job to find this out during the August Bank Holiday heat.

"J. BUTLER."

"Replying to yours of the 11th, re the short circuiting of Bosch magnetos through patent leather covers,

we beg to point out that this has of late become quite a common occurrence, and the cause is that the leather absorbs so much moisture that it becomes more or less a good conductor, and the same effect would be produced on any material that will absorb moisture, and for this reason we have put on the market hard fibre covers, which we have found the best material for resisting water, and if these are varnished they are perfectly satisfactory. With regard to the glaze on the leather, we are not aware that there is any ingredient used in the preparation of this to make it any way more conductive than the other part of the leather, and believe that the shorting is simply and solely due to moisture.

"THE BOSCH MAGNETO COMPANY, LTD."

Will readers kindly note that the failure of the gear on Newman's Roc machine which was mentioned in our report of the A.C.U. London to Plymouth and back run was not the two-speed gear in the back hub fitted to the Roc machines but the timing gear of the engine. A taper pin which holds the timing wheel to the shaft broke, and one half of it fell between the revolving pinions, causing three of the teeth to be broken.

CURRENT CHAT

SPECIAL FEATURES

MY RECORD RIDE.

By Arthur W. Bentley (Illustrated).

THE SCOTT TWO-STROKE MOTOR BICYCLE (Illustrated).

S.R. Jones

An Echo of Newnham

Mr. A. W. Bentley wishes us to inform our readers that the machine he rode at Newnham was an ordinary standard Triumph.

T.T. Motor Cycle Race.

Practising on the course for the above race begins to-morrow, Thursday, Sept. 3rd, and ends on Monday, Sept. 21st. A map of the course appears on page 681, and a contour section of the road will be found below.

Roads to the Coast.

The surface of the road to Herne Bay and Whitstable is now tarred, and it is a capital run down to the sea *via* Rochester and Sittingbourne. As a centre for a motor cycle tour Herne Bay and Margate are very popular. The roads in this district are mostly flat, and for this reason the district can be recommended for touring on single-gear passenger machines.

A Revolutionary Machine.

A motor bicycle which has attracted a considerable amount of attention of late is Mr. Scott's twin-cylinder two-stroke motor cycle, a description and illustration of which are published on page 682. Mr. Scott's endeavours to provide an efficient engine which is also an easy starter have borne fruit already. At the Bradford M.C.C. hill-climb at Wass Bank, and the Coventry M.C. hill-climb at Newnham, it competed with other twin-cylindered machines, and on the A.C.U. or Professor Callender's formula it was awarded first position. Several competitors in both the above events are of the opinion that a two-cycle motor should not be allowed to compete against a four-cycle on formula. The opinions of our readers are appearing in the correspondence pages. It appears as though this is a similar case to that of steam *v.* petrol.

Identification Mark Obscured.

At the Godalming Police Court on the 24th ult. Arthur Young was summoned for allowing the rear identification mark of his motor bicycle to become obscured on the 20th ult. P.C. Lightfoot deposed to seeing the defendant's rear number-plate covered with fresh mud. Defendant said it was clean when he got off at Guildford, and the road from there was very muddy. Ordered to pay the costs. Motor cyclists should keep an eye on their number-plates in muddy weather.

D. R. Clark (2½ h.p. Century), winner of the Mile Time Trials at the A.C.U. Race Meeting on the 24th ult. Time, 1m. 5½sec.

A Puncture Record.

"Misfortunes never come singly" is an old saying, exemplified in the case of Mr. D. S. Baddeley, who experienced a failure to the front wheel bearing, lost his way, and used up three air tubes, fifteen patches, one pump, and one rubber-studded cover, in the London-Land's End-London ride. He rode altogether 1,000 odd miles in four days. This, combined with tyre repairing, can only be described as hard labour.

Favourite Motor Cycle Resort.

Writing to the *Times* Sir Martin Conway states that 200 motor cycles were garaged at Folkestone on August Bank Holiday. The majority of motor-ing visitors came from outside the county. £40,000, he estimates, were spent in Kent by motorists alone during the three days of the holiday. Thus dustless roads, well patrolled by motor cyclists, and a reasonable police force, are of benefit to the county financially.

Police Detectives on Motor Cycles.

Two Sevenoaks police detectives are, we understand, using motor cycles to assist them in their investigations of the mysterious murder case at Seal, situated within a few hundred yards of the Maidstone main road. Meanwhile, motor cyclists are well advised to exercise care when riding alone and after dark in the quiet Kentish lanes. With the exodus to the hop gardens the roads are frequented by dangerous characters. Carry good lamps, as on the surface of dark tarred roads foot-pads are only recognisable a few yards away.

The Late Secretary of the C.T.C.

We are asked to issue an appeal to motor cyclists for donations towards "The Shipton Assistance Fund." Hundreds of motor cyclists who were at one time cyclists will remember Mr. E. R. Shipton's services to the pastime of cycling, and may wish to send a donation to the fund which is being subscribed to provide him with a small annuity. Mr. Robert Todd, chairman of the A.C.U., is the chairman and hon. treasurer of the committee, and any remittances may be addressed to him at 5, Percy Circus, W.C. A full statement of Mr. Shipton's case will be sent to anyone applying to Mr. F. Maclean at the above address.

A Contour Sectional Map of the Tourist Trophy Motor Cycle Course in the Isle of Man. As last year, the start and finish will take place at St. John's, near Ballacrine. The highest point on the course is the summit of Crag Willey's Hill, which is about 800 feet above the level of the sea, and 400 feet above St. John's. A map of the course appears on page 681.

Hill-climb at Trouville.

Thirteen motor cycles competed at the hill-climb at Trouville on Wednesday last organised by *Les Sports* and called "The Course de Côte du Calvaire." The results were:

Motor bicycles weighing less than 66 lbs.—1, Berlie (Moto-Rève), 1m. 4½s.; 2, Pontié (Moto-Rève), 1m. 18s.; 3, Pons (N.S.U.), 1m. 24½s.

Motor bicycles with engines not exceeding 212 cubic centimetres capacity.—1, Contant (N.S.U.), 1m. 39½s. The fastest time was made by Rawlinson (Darracq car), viz., 44s.

A Tourist Trophy Racer.

We omitted to mention in our last issue in describing Mr. C. B. Franklin's Tourist Trophy racer that it was provided with a Ruthardt magneto, which Mr. Franklin says is most satisfactory. The machine was originally fitted with a coil and battery, but the magneto proved more convenient, although the rider informs us that he does not find that there is any increase in power with the magneto over a battery and coil.

Pedalling in the T.T. Race.

The preliminary regulations for the International Auto Cycle Tourist Trophy Race are before us, and it is interesting to note that Rule 6 says that the machines entered must be touring machines without pedalling gear. Readers will remember that there was a good deal of correspondence last year with respect to the pedalling indulged in by some of the riders in this competition, and the Auto Cycle Union is to be commended for its decision this year, viz., that no pedalling is to be allowed. Such a decision clears the air and leaves no doubt in the minds of competitors.

A Case of Obstruction.

The thanks of the motoring community are due to Mr. Harold R. S. Walford, a motor cyclist, for the trouble he took the other day in bringing to justice the driver of a horsed vehicle who obstructed his progress on the road at Bridport. The vehicles met and the cart was on its wrong side and would not allow the motor cyclist to pass, notwithstanding that he sounded his horn and shouted,

eventually causing him to dismount on the kerb. The motor cyclist followed the cart and tried to get the driver's name and address, but these the driver refused to give. Witnesses were secured and eventually a policeman was found. The hearing of the case resulted in the horse driver, Mark Doble by name, being fined £2 and £1 8s. costs, and the magistrates thanked Mr. Walford for bringing the case before their notice.

Next Year's Provincial Meetings.

The Motor Union has accepted the invitation of the Welsh A.C. to hold one of the provincial meetings of 1909 in South Wales. This will be the first Motor Union gathering held in this important centre.

a new plate made, and by some mental confusion he must have mixed up the two numbers. There was no fraudulent intention. Supt. Jennings said he would like to inform the Bench of the great importance the police attached to the identification mark, to their mind it was everything. Fined £1 and costs.

Week-end Riding Conditions.

The surface of the roads last week-end provided plenty of variety. Owing to the locality of the rainstorms it was possible to ride in a dust cloud one minute and the next to be splashing through pools of water and liquid mud.

Mounting with a Sidecar.

A correspondent gives the following tip for mounting a motor cycle with sidecar, the idea having occurred to him after reading "Ixion's" remarks about the difficulties of mounting when the machine is on the right hand side. He says, "The best method in which to proceed is to stand immediately behind the sidecar with the left hand on the left handle of the bicycle controlling the switch, and the right hand behind the carrier of the bicycle. This enables one to exert the maximum push with the greatest ease with the help of one's shoulder against the chair, and then, when started, it is a simple matter to put the left foot on the cross-stay which connects the sidecar to the bicycle at the back. Next move the right hand on to the handlebar and step with the right foot over on to its footrest and the left foot to follow on to its footrest."

Tyres in the End-to-end.

Owing to a printer's error the tyres fitted to Mr. T. K. Hastings's machine in the End-to-end run were described at Good J. tyres in the last issue. The name of these tyres is, of course, G. and J., a well-known American make.

The T.T. Motor Cycle Race.

The prizes presented for the T.T. Race fall short of those given last year. Mr. M. J. Schulte has, however, kindly promised a silver cup for the best performance by a private owner on a single-cylinder machine. The Fund may also be sufficiently large to enable the A.C.U. to provide some cash prizes.

Juvenile Accessory Thieves.

Motor cyclists are warned to beware of juvenile excursionists from the slums who are transported to country lanes and roads for fresh air, particularly down south. Conversing this week with Mr. Sleath, a well-known Leamington trader and a motor cyclist to boot, he told us that when repairing a tyre of his Motosacoche near Brighton the other day he had a 1s. 6d. touring map, a screwdriver, and his goggles stolen by these juvenile admirers of his tyre repairing efforts. A whispered consultation among the little thieves disclosed the whereabouts of his goggles, but they got away with the map and the screwdriver, and there were quite enough of them to take the bicycle.

FUTURE EVENTS.	
Sept. 3—Daily practising begins for International Auto Cycle Tourist Trophy Race. Daylight to 8 a.m.	
" 4—A.C.U. Run to Norwich.	
" 5—R.A.C. General Committee Meeting at Norwich. Members of the A.C.U. are invited to attend the various functions at Norwich.	
" 12—Motor Cycling Club Petrol Consumption Tests.	
" 12—Brooklands R.A.C. Meeting.	
" 12—Newcastle and District M.C.C. Hill Climb.	
" 18—Motor Union Provincial Meeting at Oxford.	
" 22—The International Auto Cycle Tourist Trophy Race in the Isle of Man.	
" —Penalty Run for Members of the A.C.U. and Clubs in the South of England Districts affiliated to it.	
Oct. 10—A.C.U. Council Meeting at Leamington Spa.	
" 21—Motor Union General Committee Meeting.	
Nov. 20-28—Thirty-second Annual Stanley Show, at the Agricultural Hall, Islington.	
" 28 to December 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories.	

A Curious Offence.

At the Godalming Police Court on the 24th ult. Henry Smith Bilbe was summoned for driving a motor bicycle at High Street, Godalming, on the 9th ult. with a false identification mark. Defendant pleaded guilty. P.C. Plowman said the front number was LC 6272, and the rear LC 6227. Defendant on oath said the proper number was 6227, and that of a former machine was 6272. A few weeks ago he had to have

M.C.U.I. (Dublin Centre) Speed Trials at Portmarnock, described in the last issue, page 672. The start of the Final of the Four Miles Handicap. Reading from the right—Dr. Kennedy (2 h.p. Moto-Rève), Messrs. R. Walter (Jap), H. Quinn (Triumph), P. Hurse (Peugeot), and T. Dunphy (F.N.).

The Tourist Trophy Motor Cycle Race.

THE last day for receipt of entries for the above race was yesterday, Tuesday, September 1st, and although at the time we went to press it was impossible to include the names of the very latest entrants received, we are able to give the names of all who had entered up to and including Monday last. They are as follows:

Entrant.	Make of motor cycle.
*Mr. C. R. Collier ...	Matchless-Jap
Mr. H. Collier ...	Matchless-Jap
Mr. H. Collier ...	Matchless-Jap
†Mr. H. Rem Fowler ...	5 h.p. Norton
Triumph Cycle Co., Ltd.	3½ h.p. Triumph
Triumph Cycle Co., Ltd.	3½ h.p. Triumph
Triumph Cycle Co., Ltd.	3½ h.p. Triumph
Bat Mfg. Co. ...	6 h.p. Bat-Jap
Mr. W. H. Wells ...	5 h.p. Vindec Special
Mr. R. W. Ellis ...	3½ h.p. Rex
Mr. W. H. Bashall ...	6 h.p. Bat-Jap
Mr. C. Gordon Gibson ...	3½ h.p. Triumph
Mr. Noel E. Drury ...	5 h.p. Jap
Mr. C. B. Franklin ...	3½ h.p. Chater-Lea-Jap
Mr. S. C. Perryman ...	5 h.p. Norton
Brown Bros. ...	3½ h.p. Brown
Mr. W. H. Wells ...	5 h.p. Vindec Special (second machine)
Mr. W. Gurr ...	5 h.p. F.N.
Mr. A. J. Moorhouse ...	5 h.p. Rex
Mr. W. G. McMinnies ...	3½ h.p. Triumph
Mr. H. Lister Cooper ...	3½ h.p. Triumph
Mr. E. G. Young ...	3½ h.p. Young-Bentinck
Mr. H. Brown ...	3½ h.p. Triumph
Mr. H. Reed ...	5 h.p. Dot
Rex Motor Mfg. Co. ...	3½ h.p. Rex
Rex Motor Mfg. Co. ...	5 h.p. Rex
Rex Motor Mfg. Co. ...	5 h.p. Rex
Rex Motor Mfg. Co. ...	3½ h.p. Rex

Entrant.	Make of motor cycle.
Rex Motor Mfg. Co. ...	5 h.p. Rex
Mr. R. O. Clark ...	5 h.p. (four-cyl.) F.N.
* Holder (single-cylinder trophy).	
† Holder (multi-cylinder trophy).	

The total number of entries has now reached thirty, so there is no fear of the postponement of the contest on account of lack of entries.

The race is for perpetual trophies presented by the Marquis de St. Mars and Dr. Hele Shaw, F.R.S. The present holders are: Single-cylinder, C. R. Collier, 3½ h.p. Matchless-J.A.P.; twin-cylinder, H. Rem Fowler, 5 h.p. twin Norton-Peugeot. For this year the allowance of petrol, which will be supplied by the A.C.U., will be for single-cylindered machines, 1 gallon for 100 miles; and for multi-cylindered machines, 1 gallon for 80 miles. This is a less quantity than last year, for in 1907 the competitors were allowed 1 gallon for 90 miles and 1 gallon for 75 miles respectively.

No pedalling will be permitted this year, whereas in 1907 there was no ruling on the subject, and some competitors pedalled and others did not. This caused a certain amount of heart burning and recrimination, and several letters on the subject appeared in our correspondence columns.

It is interesting to note that all engines will be tested for silence by the judges prior to the race, and any engines which are not efficient in this respect will be disqualified if the fault is not rectified.

Mr. M. J. Schulte has kindly offered a silver cup for the best performance by a private owner on a single-cylinder machine.

Hull and East Riding A.C.C. A group of officials and competitors photographed on the occasion of the Club Hill-climbing Competition at Spout Hill, Brantingham, on Saturday last.

MURATTI TROPHY RELIABILITY TRIALS.

At a meeting of the Ulster Centre, M.C.U.I., held on Friday last, the result of the above competition was considered. When the riders finished on the 22nd ult. it was found that J. Stewart (holder), C. E. Murphy, J. J. Kennedy, and C. V. Blake (all on 3½ h.p. Triumphs) had received the maximum number of marks, 80 for each day, making 160 for the two days. On a closer examination of the times, however, it was discovered that some differences existed, and in consequence of this it was decided to communicate with the timekeepers of several of the controls in order to have the figures verified before announcing any result; hence the delay in not publishing this sooner. After consideration of the replies it was found that Stewart and Murphy had ridden exactly to schedule time throughout the two days, and as it

was impossible to find the slightest difference between their performances it was decided to ask them to re-ride the Derry portion of the contest (some two hundred miles) in order to decide the winner, if possible, starting one rider fifteen minutes after the other. Kennedy having ridden closer to schedule than Blake, was placed third, and Blake fourth. The marks awarded to the other riders were: J. J. O'Rawe (¾ h.p. Rex), 151; T. Moles (3½ h.p. Triumph), 148; J. M'Cann (3½ h.p. Triumph), 138; R. Sharpe (3½ h.p. N.S.U.), 131; and W. J. Andrews (3½ h.p. Rex), 120.

Will R. F. Heron, who writes from Folkestone under date of the 21st ult., kindly send his postal address to the Editor to enable his query to be inserted?

CLUB NEWS.

South-eastern A.C.A.

The S.E. Auto Cycle Association has definitely decided to hold the autumn open hill-climb as originally intended. A novel feature will be introduced to test the flexibility of the engines. The idea is to start the competitors at the foot of the hill as usual, but to only time them for the competition from a point half-way up the hill on the first half. The riders will be obliged to keep within fifteen miles per hour, and all those covering this portion faster will be disqualified. This will give the officials an opportunity to judge of the flexibility required when touring and striking an unknown hill.

Leeds M.C.C.

The result of the hill climb at Stainburn Bank, Leathley, has now been declared as follows: 1, Jack Scriven (5 h.p. Rex), Triumph cup and gold medal; 2, R. Bolton (5 h.p. Rex), silver medal; 3, E. Slater (3½ h.p. Triumph), bronze medal.

Fastest time of the day was also made by Mr. Jack Scriven, on his twin Rex.

At a meeting of the committee held on Friday night last, it was decided to include an open class in the speed contest to be held on a private and prepared track in Templenewsam Park on Sept. 12th (by kind permission of the Hon. Mr. Wood). As its title implies, this class is open to all and for any motor cycle. The winner will receive the club standard bronze medal and a certificate. Any motor cyclist wishing to enter should send his name with make of machine to Mr. F. C. Bagshaw, 4, Ash Grove, Headingley, Leeds, as early as possible, and certainly not later than Monday, September 7th.

On Friday and Saturday next, September 4th and 5th, the club has arranged a special two days' non-trade reliability competition to Scarborough and back, the arrangements for which are in the hands of the trials hon. sec. (F. C. Bagshaw) and Mr. Geo. Horner.

Hull and East Riding A.C.C.

The result of the non-stop run held on the 13th ult. is: 1, H. Thomlinson (4 h.p. Stevens), 100 marks; 2, A. A. Plumpton (3½ h.p. Triumph), 95 marks; 3, R. Pearson (3½ h.p. Minerva), 90 marks. The judges have penalised all the competitors ten marks each for disobeying the rules of the Scarborough Reliability Trial held on July 11th last, and recommend that Messrs. Straker, Pearson, and A. Rester should run in a speed-judging contest of one mile

A handsome trophy presented to the Leeds M.C.C. by the Triumph Cycle Co., Ltd., and won recently by Mr. F. Greenwood, of the Leeds Club, who rode a 3½ h.p. Rex Tourist Model. Above is Mr. Greenwood photographed during the progress of the competition in which the trophy was won.

for the first, second, and third places, and that Messrs. Thomlinson and Mumby should run for fourth place (tie). A non-stop run to London will be held on September 12th, particulars to be announced. The picnic originally announced for that date is postponed until the following week. On Saturday last a hill-climbing competition took place on Spout Hill, Brantingham. There were thirteen entries, and the results will be announced when passed by the judges.

Herts County A.C.

With regard to the paragraph published last week under the heading of "An Open Autumn Hill-climb," Mr. A. J. Salmon, the hon. secretary of the Herts County A.C., writes to say that the idea of awarding a certificate to every rider who climbs the hill in a hill-climbing competition is not a novel one. The Herts County A.C. has always made a point of doing so in all its events.

Sheffield and Hallamshire M.C.C.

The above club held its annual hill-climbing competition on Saturday last, on a very steep hill situate between the Rivelin New Road and Stannington. A good entry resulted as follows: 1, T. W. B. Durant (3½ h.p. J.A.P.); 2, F. Donovan (3½ h.p. Triumph); 3, F. Dover (3½ h.p. Triumph). J. W. Ardern (3½ h.p. P. and M.) earns the consolation prize.

A committee meeting will be held to-morrow (Thursday), when any member will be welcome.

Essex M.C.

The twenty-four hours run from Woodford to York and back was held last week-end, and seventeen members started from Woodford on Saturday evening, of whom eleven finished at 6.30 the next evening. The riders were well checked, and the run was much enjoyed, except for the rain near the end. In parts the police were very active. The following finished the long run to time: A. G. Reynolds, F. Smith, H. Silverlock, F. W. Applebee, E. Leverett, W. Pratt, H. R. Dougal, A. J. Sproston, A. Howard, J. Browning, and J. Everett.

Dublin and District M.C.C.

A hill-climb under the auspices of the above club was held at the Long Hill, Sugar Loaf, Co. Wicklow, on Saturday last, August 29th. The event was poorly supported, owing to the inclement nature of the weather, and the surface of the hill being very greasy and treacherous in parts. Only five competed, and the results were decided on the formula

$\frac{W}{C \times T}$	Position on time. M. s.	Position on formula. Per cent.
1. C. B. Franklin ($3\frac{1}{2}$ h.p. Jap)	... X	... 100.0
2. R. H. Taaffe ($3\frac{1}{2}$ h.p. Triumph)	... 51 $\frac{2}{5}$... 75.8
3. J. Doleman ($3\frac{1}{2}$ h.p. Rex)	... 2 12 $\frac{3}{5}$... 63.0
4. F. J. Walker (5 h.p. Rex)	... 1 20	... 47.0
5. M. J. Chambers ($2\frac{3}{4}$ h.p. F.N.)	Retired owing to side-slip.	

Cardiff M.C.

The Cardiff club intends to hold a closed reliability trial for motor cycles and cars on Saturday next, the 5th inst. The total distance to be covered is seventy-eight miles at a speed of eighteen miles an hour or less. Competitors meet at Roath Court at 1.45, and start at 2 p.m. There will be two prizes awarded. It is interesting to note that no competitor will be permitted to use solid tyres or tyres provided with any filling. Reliability trials have truly become a test of tyres, and should now be entitled "Tyre Trials."

Inter-club Meet of Midland Motor Cyclists.

As announced last week, we now have pleasure in giving particulars of what transpired at the above meeting of motor cyclists held at Stratford-on-Avon on the 24th ult.

It was proposed that a central body of Midland M.C. clubs' representatives be formed with a view to making all arrangements for the meet, and also to keep the various clubs in closer touch with each other.

This proposition was unanimously carried, and it was arranged that each club should have two representatives for every fifty members or less, and one representative for every twenty-five additional members, the club secretaries to be appointed representatives as far as possible.

This body will meet early in each year to arrange for the general meet, but beyond this no call will be made on them. Clubs desirous of joining this central body and taking part in next year's meet are asked to communicate with Mr. R. Vernon C. Brook, Eastgate, Greenhill Road, Moseley, Birmingham, who will supply full particulars.

It was also resolved that each club approach its members at its next general meeting on the subject of making the Whitsuntide meet the occasion of a gymkhana.

The meet was voted a great success, and it is hoped that now it has been successfully launched by Mr. Brook, to whom a vote of thanks was unanimously passed for his efforts, it will continue to grow year by year.

Club News.—

Western District M.C. (London).

A committee meeting of the above club was held on the 6th ult., when it was decided to hold the annual hill-climb on September 20th. There will be separate classes for singles and twins. Members wishing to enter for this will kindly notify the sports secretary, Mr. C. N. Gould, 10, High Road, Heston, W., as early as possible.

A Club for West Calder, N.B.

A meeting will be held on Saturday next, September 5th, in Thomson's Rooms, West Calder, at 9 p.m. sharp, to discuss the advisability of forming a local motor cycle club. All interested are requested to attend so as to secure a good representation at the first meeting. Will club secretaries send copies of rules, etc., to Alan J. Steuart, hon. sec. pro tem., Westwood, West Calder, N.B.?

Perth and District M.C.C.

The Perth and District M.C.C. held an all day reliability trial on the 26th ult. The route was by Greenloaning, Luthill, Crieff, Comrie, Lochearnhead to Killin, where luncheon was served, continuing by Fearnan, Coshieville, Whitebridge, Kinlochranoch, Struan, to Pitlochry, for tea, and home by Bankfoot. The weather up to Killin was good, but during luncheon it began to rain, and continued for the remainder of the run. The total distance is about 140 miles, and there were six controls. The first three competitors in order of merit were James W. Robertson (lost no marks), Bruce Syme, and D. Bachelor.

Newcastle and District M.C.C.

Competitors in the above club's flexibility test will start from North Gate, Morpeth, at 2 p.m., on Saturday next, the 13th inst. The competition will be divided into four classes: Class I.—Single-cylinders, fixed gears; Class II.—Twin-cylinders, fixed gears; Class III.—Variable gears; Class IV.—Passenger machines and tricycles. The final of the team trials will take place on the following day, starting from North Gate, Morpeth, at 10.30 a.m.

On the 12th inst. a closed hill-climb will be held for single and twin-cylinder motor bicycles and passenger machines, the winners to be decided on A.C.U. formula.

Basingstoke and District M.C.

The Henley branch of the above club held its speed-judging contest last Wednesday, August 26th. Bad weather prevented a really good attendance, only six members turning out. The result and placings were as follow:

- | | |
|---------------------------------------|---------|
| 1. A. F. Plint (3½ h.p. Kerry) | 28s. |
| 2. M. Carpenter (¾ h.p. Rex) | 2m. 2s. |

Also competed: H. Linford, G. Ayling, F. Ellis, and L. Wright.

The winner scores three marks and the second man two marks towards the club gold medal, whilst the remainder receive one mark each for attendance.

The committee has elected Messrs. J. E. Pool and Geo. Watson, M.I.A.E., as representatives on the R.A.C. General Committee. The former hopes to be present at the Norwich meet of the R.A.C. and A.C.U.

Newcastle M.C.

A novel competition for cars, passenger cycles, and motor bicycles is to be held on Wednesday, September 9th, by the Newcastle Motor Club. It follows the lines of an ordinary non-stop trial, with the addition that, when entering for the event, competitors have to declare the value of their machines, and on this declaration the handicap will be framed, one point being allowed for each pound (£1) difference. For example, three machines, A, B, and C, are entered at £10, £20, and £30 respectively, A would have ten points start of B, and twenty of C, and B would have ten from C, which, as the highest priced machine, would be on scratch. Any member may claim a machine at the declared figure, and if there is more than one bid the machine will be put up for auction, the surplus value (if any) to go to the club funds. In the trial proper, all machines will be penalised equally, viz., one point for every fifteen seconds or fraction of same they arrive at controls before or after schedule time. The course is one of seventy-six miles, and the competition is open to all members of the North-eastern Automobile Association, who can obtain entry forms, etc., from the hon. secretaries, Messrs. J. Wilford and J. P. Robson, 119, Gloucester Road, Newcastle. Entries close on Monday next, September 7th.

Essex M.C.

In consequence of the abandonment of the 200 miles non-stop run, it has been decided to hold an autumn hill-climb, particulars of which will be published later. A very steep hill has been found, and machines will require to be in very good form to climb it.

Bradford M.C.C.

The above club has decided to hold on Saturday, October 3rd, an open hill-climb. A trophy in the form of a silver cup (to be won outright) will be awarded to the rider making the fastest time of the day, whilst gold medals will be awarded for other meritorious performances. The venue of the hill, and further particulars will be announced in due course, and any affiliated club may have a copy of the rules and regulations, on application to the trials hon. secretary, Mr. F. Scriven, Alma House, Bradford.

Birmingham M.C.C.

A competition for the Triumph medal and Premier lamp will be held on Saturday next. The competition will take the form of a fifty miles petrol consumption test, which will consist of two circuits over a twenty-five miles course. Competitors will meet at the King's Head, Hagley Road, at 2.30 p.m. sharp. The distance must be covered at a speed not exceeding twenty miles per hour, or less than eighteen miles per hour. Marks will be awarded according to the petrol consumption, worked out on formula, and marks will be deducted at the rate of twenty for every minute late, and ten for every minute early at controls. Entries should be sent to the trials hon. sec., Mr. R. Vernon C. Brook, Eastgate, Greenhill Road, Moseley, Birmingham, not later than Friday next, the 4th inst.

Motor Cycling Club.

The Motor Cycling Club's annual petrol consumption trial for motor cycles and cars will take place on September 12th, starting from Gerrard's Cross on the London-Oxford Road at 3 p.m. This event is always very popular, and in addition to a most interesting competition members can be assured of a pleasant social reunion.

The competitors receive a given amount of Shell spirit according to the total weight of the machine, driver, and passengers. The course is five miles in extent, and the winner in each class will be the competitor who drives farthest on the allowance of petrol.

Entries close on September 7th, and should be sent to the trials hon. sec., F. J. Jenkins, 35, Loveday Road, Ealing, W. A good deal of assistance is required for marshalling the course, and members willing to help will oblige by communicating with the trials hon. sec. as above.

Speed Trials at Portmarnock.

* Pressure on our space prevented us giving the detailed results of the speed trials at Portmarnock held by the Dublin Centre, M.C.U.I., on the 24th ult. They are as follow:

TWO MILES HANDICAP (OUT AND HOME).

	Start.	Time.
1. C. B. Franklin (3½ h.p. Jap)	20s. ...	2m. 55½s.
2. R. Dunphy (3½ h.p. Jap)	30s. ...	3m. 7s.
3. R. Walshe (2¾ h.p. Jap)	40s. ...	3m. 50s.
Won by 1¼s.; 13s. between second and third. Time of race, 3m. 35½s.		

FOUR MILES HANDICAP (DUNLOP CUP).

	Start.	Time.
1. R. Walshe (2¾ h.p. Jap)	scr. ...	7m. 21s.
2. P. Hurse (2¾ h.p. Peugeot)	30s. ...	7m. 51½s.
3. H. Quinn (3 h.p. Triumph)	30s. ...	8m. 3¾s.
Won by ¾s.; 12½s. between second and third. Time of race, 8m. 1s.		

FOUR MILES HANDICAP (CONFINED TO DUBLIN AND DISTRICT M.C.C.)

	Start.	Time.
1. C. B. Franklin (3½ h.p. Jap)	30s. ...	8m. 26½s.
2. R. H. Taaffe (3½ h.p. Triumph)	40s. ...	9m. 30s.
Won easily. Time of race, 9m. 16½s.		

TWENTY MILES HANDICAP (OUT AND HOME).

	Start.	Time.
1. C. B. Franklin (3½ h.p. Jap)	3m. ...	28m. 52½s.
2. R. Dunphy (3½ h.p. Jap)	3½m. ...	31m. 26s.
3. P. Hurse (2¾ h.p. Peugeot)	9½m. ...	42m. 9¾s.

Franklin took the lead at half distance, and won easily by 2m. 4s.

Mr. T. W. Murphy acted as starter and timekeeper.

QUESTIONS & REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, must be accompanied with a stamped addressed envelope for reply.

Leeds to Yarmouth.

? Could you kindly tell me the best and quickest way per motor cycle from Leeds to Yarmouth?—R. SHRUB, Hyde.

Leeds to Aberford, or the nearest point on the Great North Road, or Leeming Lane, which you know of, then travel down *via* Doncaster, Newark, Grantham, and Stamford to Peterborough. Leave the North Road at a point called Kate's Cabin, the route is then Wisbech, Downham Market, Swaffham, Dereham, Norwich, Caistor, and Great Yarmouth.

Difficulty in Starting and Heavy Consumption.

? I have a 1908 Triumph motor bicycle which I find rather difficult to start. If I start in the orthodox way and jump on I find that as soon as explosions take place the machine starts at such a pace as to make it dangerous for me to mount. Could the difficulty be met by adopting a free engine clutch or change-speed gear, and would the use of either of these necessitate the removal of either the back brake or the pedals? I find that my motor does only some fifty to sixty miles to a gallon of petrol, but when started it runs perfectly. Should I take any steps with reference to the petrol consumption, as I see in *The Motor Cycle* that it is possible to run 100 miles with the same amount.—H. WELL, Greenwich.

A clutch, or preferably a change speed, would certainly enable you to start more easily. As to whether it would interfere with the fitting of the brake rod for the foot brake depends on the type. To mount adopt the following method: Run machine for a yard or two with valve lifter raised, drop valve lifter, and the moment engine fires lift valve lifter again, so preventing further explosions, and place left foot on pedal. Swing right leg over rear mudguard and drop into the saddle, simultaneously dropping the valve lifter the moment you are sure you have a safe seat. If you adopt this method the machine cannot run away with you, but if you try to mount with the engine firing there is a possibility of the left foot missing the pedal and causing a fall. With regard to consumption you possibly drive engine with throttle further open than

is necessary, or with air lever closed too far. 100 miles to the gallon is quite ordinary with care and with a properly adjusted carburetter, and there is no reason why you should not do the same. It is a question of skill in handling the machine, *i.e.*, having throttle cut down to a minimum and air open as far as possible consistent with speed. It is customary to ride with cut-out open in the country, but we do not think this affects consumption materially.

Knocking on Hills and Air Control.

? I should be very pleased if you would tell me the reason for my engine knocking. I have a 1908 Triumph, and it has not been ridden more than 700 or 800 miles. It knocks when I slow down for corners and have to pick up again, and knocks on the slightest hill. I have had engine down and scraped all carbon away. The engine looks all right. Once it has picked up it stops knocking. The engine gets very hot when it has only been ridden a little way. I ride with the air as far open as possible without engine misfiring, but that is not very far. Should it take more air, and how could I make it do so? In other ways the machine runs well.—C.T.W., Hants.

W. F. Merritt (3½ h.p. Triumph), a gold medal winner in the A.C.U. End-to-end Trials. This was his first competition, and he gained every possible mark.

The knocking may be due to the manner in which you drive the machine. These engines should be driven practically on the carburetter control. For instance, you must always close the air after slowing down. When climbing steep hills, unless you rush them, it is necessary to close the air lever in accordance with the speed of the engine. The slower it runs the less air it requires, and *vice versa*. There is no necessity to make it take more air. Probably sufficient air enters at the main air inlets for your requirements. If you open the throttle farther you will find engine will require more air. You might also test the timing of the magneto and see that it is not too far advanced.

Momentary Stoppage and Cleaning Oil Reservoirs.

? (1.) I have a 6 h.p. twin Bat with magneto which has run some 2,000 miles. I use the machine with a sidecar attachment, and lately it has taken to slowing momentarily and then picking up again gradually. Sometimes with the sidecar it fails to pick up if on a hill. The needle of the Longuemare carburetter is the only thing that has been altered from the makers' setting, but there is a noticeable falling off in the power of the engine, as I cannot always climb a certain steep hill in my neighbourhood that I used to get up without difficulty. (2.) Shall I have to take the magneto out of the tank to clean out the oil wells?—S.A.

(1.) It is highly probable that the momentary stoppage is caused by the level of the petrol being too low. You can check this by removing the jet, and after turning on the petrol tap note the height to which the petrol rises in the jet orifice. It should come to within ½ in. of the top. If it is lower you can alter the level by moving the weight on the needle nearer to the point. The usual cause of poor hill-climbing is bad compression. Remove the cylinders of your machine, clean them, and then grind in carefully the four valves. (2.) The oil wells can be swilled out after removing the screws underneath the reservoirs. If you cannot remove these on your machine owing to the tank or other obstructions, you will have to wait until the magneto is off the machine.

Blowing Back at the Carburetter.

? I am the owner of a 6 h.p. twin-cylinder motor cycle. Could you give me any idea of the cause and remedy for blowing back at the carburetter (not firing back). When the engine is running I can feel the air being blown out; sometimes it is negligible and the running is good, but at others it is very strong, and the engine then seems to run badly. An explanation of this would help me greatly. Should the two platinum points of the Bosch high tension magneto be insulated from each other? I tried to ascertain the exact time that they separated in order to time the engine by wiring them up in circuit with an accumulator and voltmeter, but whether they were apart or not the voltmeter always showed the full voltage. The engine, nevertheless, runs perfectly as far as firing is concerned.—U 560.

Every engine blows back slightly at the carburetter. It is an inherent defect in a petrol, or, in fact, any engine, even steam engine has a certain amount of blow back when the valve shuts. It is due to sudden stoppage of the flow of either gas or steam along the induction pipe. The reason it is worse at times than others is either because the throttle is wider open, or the inlet valves are out of order, i.e., they open too far. The amount of lift should be about .32in. unless they are mechanically operated, when they may open further. We think the reason the voltmeter always showed the full voltage is because you must have wired up two portions of the contact breaker, which were both electrically connected to the base plate. One point is insulated from the other by means of ebonite at back of block holding fixed point. Lamp should go out when points separate if wired correctly.

Knocking when Throttled Down.

? My engine (a 5 h.p. single-cylinder) has developed a very curious kind of metallic knocking, not at all like the ordinary knock from wrong mixture or spark too far advanced. It is not very noticeable when using a large amount of gas, but if the gas be suddenly cut off to about quarter throttle when running at a fairly high speed, the noise is most distressing. I took the engine apart and had a new bush put in on the pulley side and new piston rings, but this has not improved matters in any way. Both ends of the connecting rod are fairly tight, although it is possible to detect a slight movement by alternately pulling and pushing the piston. The noise sounds as if the piston overshot the mark and touched the top of the cylinder. Needless to say that this is really not so, in fact; but I have taken the engine down to see if there were anything loose being thrown up or down. The engine seems to have a fair amount of power on hills, but its speed is not like it was.—SONCIN.

The knocking complained of is evidently wear on gudgeon pin and connecting rod bearings. New piston rings unless turned to fit the worn grooves of the piston would not stop the knocking noise complained of, as it may arise from loosely fitting rings. The piston and cylinders or both may be worn at the top to a much greater extent than at the bottom, and in consequence when running light, i.e., with throttle practically closed, the noise is more apparent owing to the space above the piston not being filled with gas either under compression or being fired. The compressed gas and explosions tend to press the worn parts together and prevent noise. Directly the gas is reduced to a minimum rattling commences.

Acetylene Generators and Nail Catchers.

? (1.) Please give me your opinion of the Model E Auto-clipse generator? I cannot quite understand the principle upon which it works. I find that in two days the whole charge is generated without the lamp being lighted. I have followed directions. I find when turning tap on the water bubbles out at the hole in top of generator for some little time. I suppose this hole is the safety valve. (2.) The clips for the generator are only suitable for attaching under the saddle on the seat tube. Is this a safe place, and should I have any trouble with gas tubing? I have three pump clips and threaded the tube through these to keep it in position. (3.) Are the nail pullers any use, as I have been troubled with picking up several nails lately? I noticed one in Messrs. Gamage's catalogue—the Bull Dog. Would these be suitable for a motor cycle? Also which would be the best place to fix them up?—W. F. RIDGE.

(1.) The generator in question works on the diving bell principle; that is to say, the carbide is immersed in the water, and the gas as soon as it is generated by its own pressure automatically forces the water away from the carbide, so preventing further decomposition of the carbide. As soon as the gas generated has been consumed the water again attacks the carbide, and a further supply of gas is generated, and so on. The bubbling you hear when the generator is first put into action is probably caused by the air escaping through the safety valve. (2.) The best place to carry the generator is on the seat tube with the aid of the special clips provided. (3.) As nail pullers those you mention are quite satisfactory, but as they rest continually on the tyre they are rather soon worn out.

Round-the-World Tour on a Motor Cycle.

THE accompanying photograph is that of an enthusiastic motor cyclist, Mr. Reuben Mawson, of Birmingham, who is undertaking a lengthy business tour with the aid of his L.M.C. machine. Mr. Mawson is at present visiting Canada, and will go from there to Tasmania, New Zealand, and Australia, calling at all the important cities and towns en route. At the rear of the machine is fitted a telescopic metal sample box, in which are carried samples and other matter in connection with Mr. Mawson's own business. In addition he will make arrangements with colonial firms who may feel disposed to handle the machine he rides, which is made by the Lloyd Motor and Engineering Co., 132, Monument Road, Birmingham. The L.M.C. is an ordinary standard touring model, provided with very strong tyres and a few extra sundries which are likely to prove useful on such a long journey. It is further proof of the reliability of motor cycles when colonial travellers make use of them for lengthy tours.

Mr. Reuben Mawson, who is making a business journey round the world with his L.M.C. Motor Bicycle.

MOTOR BICYCLES FOR SALE.

HALIFAX.—1908 $\frac{3}{4}$ h.p. Rex de Luxe, two-speed, Roc clutch, twin wheel, ball bearing engine, handle-bar control, 53 guinea model; £35.

HALIFAX.—1908 5 h.p. twin Tourist Rex, magneto; owner going abroad; £35; a splendid opportunity.

HALIFAX.—1908 Rex, $\frac{2}{4}$ h.p., magneto, very low, little used, condition excellent, easy starter; £19 19s.—Halifax Motor Exchange, 16, Westgate, Halifax.

TWO-CYLINDER Motor Cycle, cost £50 three months ago; owner going abroad; will accept £35.—Greenwood, Portland Place, Halifax.

TRIUMPH, magneto (late 1906), Osborne four-speed and free engine, new tyres; accept £19 10s., excellent condition.—18, St. Malo Road, Wigan.

1907 N.S.U., $\frac{3}{4}$ h.p., Rich's tubes, new inch belt, spare pulley, valves, belt, etc., new condition; £19 10s.—Parker and Co., Lune Street, Preston.

BARGAIN.— $\frac{4}{4}$ h.p. Twin Minerva, as new, very low, only run 1,500 miles, Modele de Course tyres; £26 10s., or offers.—186, Derby Street, Bolton.

1 $\frac{1}{2}$ h.p. Werner, front drive, good running order; reason for selling, bought stronger; £6, or offers.—Cottam and Buller, West Bradford, near Clitheroe.

MANCHESTER Motor Exchange.—Agent for Phoenix, Quadrant, Ariel, etc.; any make supplied and your old machine in part payment.—Foxwell Gray, 262-4, Deansgate, Manchester.

MANCHESTER.— $\frac{3}{4}$ h.p. 1907 Model Minerva, in perfect condition; an absolute bargain for £16.

MANCHESTER.—5-7 h.p. Twin Peugeot, Chater-Lea fittings, magneto, very low and fast; £23.

MANCHESTER.— $\frac{3}{4}$ h.p. Phoenix Cob, two speeds, starting handle, free engine, cannot skid, run under 1,000 miles; £25.

MANCHESTER.— $\frac{2}{4}$ h.p. F.N., compression marvellous, brass tank, very reliable machine; £12.

MANCHESTER.—3 h.p. Humber, run very few miles, equal to new, 19in. frame, very fast and light; £14.

MANCHESTER.— $\frac{2}{4}$ h.p. Minerva, reliable, £7 10s.; $\frac{2}{4}$ h.p. Humber, good machine, £7; $\frac{2}{4}$ h.p. Quadrant, very reliable, £7.—Foxwell Gray, 252-264, Deansgate, Manchester. Phone, 404.

1908 Triumph, Goodrich, Palmer, spare Goodrich, searchlight, two generators, three belts, Middlemore saddle, Brooks seat, engine and magneto spares, full kit; £39; any test.—Holdsworth, Butcher, Burnley.

LIVERPOOL (Rex Agency).—Before buying your new mount come and have a look at our machines. The largest stock of new and second-hand machines for fifty miles round; anything taken in part payment.—F. C. Jones and Co., 3, Redcross Street, Liverpool.

MINERVA and Rex.—We carry the largest stock of spare parts in the provinces for these machines, can deliver new machines from stock at low prices; cash, exchange, or gradual payments; charged accumulators for hire, 1s. per week.—Cookson Bros., 511, Chester Road, Old Trafford.

3 h.p. Phelon-Moore, two speeded, Beeston Humber, Bosch magneto, 26in. Palmer tyres, spare Hermetic tyre, and new Rich's tube, Sthenos carburetter, footboards, stand, tubular carrier, lamp, horn, many spares, splendid order; £24.—Macintyre, East Hadson Villa, Redcar.

3 $\frac{1}{2}$ h.p. Magneto N.S.U., XI'all spring forks, Peter-Union tyres, charged with Miraculum, separate generator lamp, horn, tools, and stand, all in very good condition and little used, the lot for £30, or near offer; new Continental Model de Course cover, 26 by 2, 30s.; Rich detachable tube, 26 by 2, 10s.; new F.R.S. searchlight and generator, 30s.; old Triumph frame, for inclined engine, including tyres, stand-carrier, and two powerful brakes, what offers?—Smith, Wakefield Road, Horbury.

BOOTH'S SPICY OFFERS

SIX $\frac{2}{4}$ h.p. REX FEATHERWEIGHTS, 1908 models, nearly new, probably run 200 miles, low built, high tension magnetos, climb hills as good as some $\frac{3}{4}$ h.p. models, £19 19 0 each, or exchange.

FIVE NEW TWIN ANTOINES, $\frac{5}{4}$ h.p., 1908 models, low built, $\frac{2}{4}$ in. tyres, latest handle-bar control, smart and powerful machines, suitable for sidecar work, going at a second-hand price, £25 0 0 each, or exchange.

FOUR $\frac{5}{4}$ h.p. REX-DE-LUXE, 1907 models, fitted with magnetos, Roe clutch, twin tyres, spring forks, spring seats, cost £50 0 0, ideal sidecar machines, handle starting, £27 10 0 each, or exchange.

THREE $\frac{3}{4}$ h.p. REXES, 1907 models, spring forks, low built, good tyres, good hill-climbers and smart-looking machines, £16 16 0 each, or exchange.

SIX 5 h.p. TWIN REXES, beautiful machines, fitted with spring forks, low built, 26in. wheels, will take a sidecar anywhere, £17 17 0 each, or exchange.

SEVEN 1906 $\frac{3}{4}$ h.p. REXES, low built, spring forks, 26in. wheels, Longuemore carburetters, climbs steep hills, very reliable, £15 15 0 each, or exchange.

EIGHT $\frac{3}{4}$ h.p. REXES, very low built, both feet can be placed on the ground while seated in the saddle, 26in. wheels, Longuemores, £11 11 0 each, or exchange.

OTHER RICH BARGAINS.

Accumulators

UNSPILLABLE 1908 TYPE.

Read what a private rider says (*Motor Cycle*, July 15th, '08, letter No. 3414) when answering a letter from another reader of the *Motor Cycle*, who does not use "E.P.R." accumulators.

"If your correspondent will try 'a couple of 'E.P.R.' unspillable accumulators, I think his troubles 'will be at an end. If he cares to 'do so, he can put them in his 'tank upside down, but he will get 'no acid trouble. Unlike most of 'the unspillable type, they contain 'no jelly. I have had two in use 'for some considerable time, and 'find them excellent."

No. 20c. 4 x 2½ x 6in. "Acid type," 14/6.

No. 20c /08. 4 x 2½ x 6in. "Unspillable," 17/6.

We make these unspillable accumulators in all sizes from 5 to 50 amp. capacity. All unspillable types are sent out fully charged and ready for use. No loose acid to shake out. Full instructions with every cell. All batteries, whether usual type or unspillable, fitted with "E.P.R." non-corrosive terminals.

A FEW SIZES ARE LISTED HERE.

		"Acid type."	"Unspill."

Stand in position.

(Note "R.O.M." patent ball ends: by this means the machine can be easily moved in any direction in the garage, even with front wheel out.)

This stand is automatically locked when out of position, and cannot shake down. By means of the "R.O.M." patent eccentric action, the legs come close in to the mudguard when out of action, and yet spread well out when in use, thus securing an absolutely rigid support for the machine.

Price (to fit any machine) .. **14/6** per pair.
Illustrated list free. Prompt deliveries.

NOTE.—We are special agents for Shamrock, Goodrich, Palmer Cord, and Clincher Tyres.

10s. for your old cover (any condition), in part payment for new Shamrock and Goodrich rubber studded and Palmer Cord tyres.

The NEW CLINCHER RUBBER STUDDED NON-SKID
(as used in the late End-to-end Record).

One size, 26x2½ .. **40/-**
7/6 allowed for your old cover in part payment.

New Clincher extra heavy covers fitted with Shamrock or Goodrich rubber studded bands (ensures ½in. thickness of tread).

Prices, 26x2, 2½, **52/-, 55/-, 68/6** (7/6 allowed for your old cover in part payment). 5/- allowed for your old cover in part payment for any other make of tyre. Shamrock or Goodrich rubber studded non-skid bands fitted to your own cover, **21/-**. Heavy Bates non-slipping band, **13/-**. Extra heavy Bates non-slipping band, **15/-**. Pullman Puncture proof leather non-skid band, **17 6**.

These prices include fitting in all cases. Time taken, about three days.

Our New Tyre List free on application.

R. The only contact breaker Really suitable for twins with accumulators and coils. Ensures permanent synchronism.

O. R.O.M. means—more power, easier starting, smoother running. Illustrated list free.

MISCELLANEOUS.

TORPEDO Tank, complete with all fittings, for oil and petrol; 15s.—Green, 14, Avondale Road, Peckham, S.E.

BROOKS Patent Anti-vibratory Motor Saddle, nearly new; cost 39s., price 15s. 6d.—Houfton, Chemist, Alfreton.

GENUINE Simplex spring fork attachments, plated (brand new); 9s. 6d. pair; carriage paid.—Mitchell, 22, Leghorn Road, Plumstead, S.E.

POWELL and Hanmer and Lucas Acetylene photo motor cycle lamps; cheap; wanted, separate generator lamp.—Firemaster, Arbroath.

BULL'S-EYE Lenses.—Cut and polished glass, 3in., 3½in., 3¾in., 1s. 9d.; 3¾in., 2s.; 4in., 2s. 6d.; 4½in., 3s.; 4¾in., 3s. 6d.; 5in., 4s. each; carriage paid.—Payne, 149, Metchley Lane, Harborne.

CLINCHER A Won, 26 by 2, nearly new, 12s. 6d.; two 15 amp. Minerva accumulators, good condition, 5s. 6d. each; twin plain box coil, 10s. 6d.—Amos, 11, Lammas Street, Nottingham.

BRAND New Pair Tricar Tubes, Lloyd's free engine clutch, 2½ h.p. De Dion pattern engine, 2½ h.p. Centaur-Humber carburetter; what offers? — Particulars, A. Moyse, Kessingland.

MOTOR Driving for Beginners.—Read "A Catechism of the Motor Car," containing about 320 questions and answers explaining the construction and working of a modern motor car, by J. H. Knight, price 1s. 6d. net, of all booksellers.

MONTGOMERY Sidecar, latest 1908, not run 100 miles, cost £12 12s., take £10 to clear; Ormond frame and tank, 5s.; pair 28in. built wheels, 6s.; spring handle-bar, 4s.; spring seat-pillar, 2s.; F.N. carburetter, 4s.—Burdett, Northampton Road, Market Harborough.

SHAMROCK Belt, 3in. (new), 9s. 6d.; Advance adjustable belt pulley, fit Triumph, 10s. 6d.; Triumph exhaust valve (new), 3s. 6d.; inner tube, 26 by 2½, 4s. 6d.; pair Bosch platinum points (new), 4s. 3d.; magneto cover (Triumph), 2s.—45, Parade, Leamington.

PAIR of Minerva spring forks, new, £2; L.A.C. spring forks, 15s.; pair Wright's footrests, 10s. 6d.; 13½ steering wheel, aluminium centres, 8s. 6d.; complete steering column for tricar, with levers and wheel, £1 10s.—Wauchope's, 9, Shoe Lane, Fleet Street, London, E.C.

A. and H. CLARKES' Bargains.—Non-trembler coils, usual price 12s. 6d., clearance 7s. 6d.; sparking plugs, usual price 1s. 3d., clearance 1s., three for 2s. 6d.; ditto, usual price 1s. 6d., clearance 1s. 3d., three for 3s. 3d.; Alpha test lamps, usual price 3s. 6d., clearance 2s. 6d.—A. and H. Clarke, Coventry.

LONDON Auto Co., Union Road, Clapham, S.W., agents for Chater-Lea frames and fittings, and all makes of engines; No. 6 frames, £2 18s. 6d.; girder forks, 15s. 6d.; long handle-bars, 3s. 9d.; wheels, 30s. per pair; torpedo tanks, 8s. 6d.; low quotations for all other parts; illustrated frame and engine lists stamp.

21 h.p. Vaf Engine and carburetter, £2; 21 plain coil, 4s.; 26 by 2½ Clincher, beaded, 6s.; 28 by 2 wired Dunlop, 6s.; B.S.A. frame, for vertical engine, complete with 26in. wheels, tyres and tubes, handle-bars, chain wheel and cranks, £2; 2½ h.p. Smith and Dowse engine, £2.—Stevens, 4, Goldhawk Mews, Shepherd's Bush.

21 h.p. Engine with pulley, contact breaker, 35s.; Longuemare carburetter, 10s. 6d.; stand-carrier, 5s.; low frame, with tank, oil pump, levers, pedalling gear, 21s.; trembler coil, 12s. 6d.; Brown silencer, 3s. 6d.; 26 by 2 wheel, complete, 15s.; Singer tank, 4s. 6d.; Lightning stand, 3s.; Jack-noskid, 10s.—Darke, Draper, Sutton.

JAP Multiple Plate Clutch, new, fit any engine, cost £5 10s., 50s.; Jap patent drip lubricator, 7s. 6d.; new Jap twin contact breaker, complete, iridium points, 10s.; rubber covered footboards, nearly new, cost 30s., plated edging, 8s.; back Bowden brake, perfect, 6s.; new 4 h.p. silencer, quiet, plated, 6s.; 2½ h.p. aluminium silencer, 2s. 6d.; twin plain coil, perfect, 10s.; charging dynamo and water motor, cost £4, 30s.; all above guaranteed perfect.—Longford, Uddington.

MISCELLANEOUS.

AUTOGENOUS Welding.—Send that broken casting to the Alvaston Motors, Derby, to be welded by patent process; metal reunited.

AUTOGENOUS Welding.—Costly castings saved from the scrap by our process. Cracked valve seats, water jackets, cylinder liners, pistons, frames, connecting rods, and a thousand other things.

AUTOGENOUS Welding.—Wonderful results. Broken flanges, lugs, brackets, etc., all amenable to our process; send part to-day; quotations on sight.

AUTOGENOUS Welding.—Alvaston Motors, Derby. Telephone, 1, Alvaston.

LUGGAGE Carriers of every description. —Send for particulars, Advance Motor Mfg. Co., Northampton.

BARKER'S Iron Cement, for cracked cylinders and defective castings; 1s. tin.—34, Oxford Road, Worthing.

TREMBLER Coil, 10s.; 20 amp. accumulator, 6s.; new gas lamp, 12s.—80, Palatine Road, Stoke Newington.

DRUMMOND T.S.C. Lathe, complete, with chucks and tools, etc. (all brand new); £12 4s.—J. Richmond, 111, Larkhall Lane, S.W.

GENT'S 18ct. Gold Keyless Chronograph Stop Watch, cost £15, take £6 15s.; approval.—Holloway, 21, Wakefield Street, East Ham.

FRAME, with tanks and back wheel, fitted Phoenix two-speed and free, chain drive, suit 5 h.p. twin, or single; pair C.L. handle-bars, £4.—Haydon, Twyford, Berks.

10 Amp. Accumulator, 4s. 6d.; 40 amp. Pfluger accumulator, 15s.; 8ft. 3in. Dermative belt, new, 9s. 6d.; 28in. by 2in. Clincher cover, beaded, 8s.—31, Herongate Road, Wanstead.

LONGUEMARE G. Carburetter, suit 3½-4½ h.p., 7s. 6d.; Minerva belt, 6s.; trembler coil, perfect, 8s. 6d.; 26 by 2½ Bates tube, unused, perfect, 7s.; Peter-Union 24 by 2½ tube, unused, 6s.—Mitchell, 457, Lord Street, Southport.

BARGAINS.—700 by 65 mm. Heavy Clincher, 7s.; 28 by 2 Michelin, 7s.; Kerry compartment tank, 21 by 8 = 4, 6s. 6d.; 2½ h.p. Humber engine, fitted V pulley and free engine clutch, and top tube lever, £3 15s.—Holmes, Laira Avenue, Plymouth.

DE DION Engine, 3½ h.p., water-cooled, large Longuemare carburetter, silencer, round Basse-Michel coil, 20 a.h. accumulator, all perfect, £6 15s.; tricar front seat, wicker, upholstered, Cee springs, all clips, £1.—Motor, 102, Mare Street, Hackney, London, N.E.

26IN. by 2½in. Michelin Covers, good condition, 25s. pair; one 26 by 2 wired Dunlop, fitted with punctureproof band, nearly new, 8s. 6d.; also large Lucas motor Luminator gas lamp, new condition, 10s. 6d., cost 25s.—Cress, 116, Archway Road, Highgate, N.

LATEST No. 6 Frames, £3; tanks, all patterns, from 5s.; sidecar chassis (Chater-Lea), £3 10s.; long handle-bars, 4s.; swan-neck, 2s. 6d.; all to your own requirements; machines cut down, and repairs of every description; quick deliveries.—Green Bros., 14, Avondale Road, Peckham, S.E.

4 h.p. Oracle Engine, M.O.V., perfect working order, £3 18s.; carburetter for same, 12s.; coach-built forecar body, 16s.; Simplex stand, 4s.; carburetter, about 10 h.p., £1; Palmer cover, 26 by 2, brand new, £1; ditto, almost new, 17s.; Clincher ditto, 9s.; tube, 5s.; pedalling gear, brakes, chain wheel, rubber pedals, chain, 9s.; strong front brake, 4s. 6d.; plain coil, perfect, 8s.—62, Colvestone Crescent, Dalston, London.

TRADE Direct and Save a Profit.—The Albany waterproof jackets for motor cycling, in double texture fawn paramatta, wind and rainproof, stock lengths, 38in. and 40in., chest measures 36, 38, 40, and 42in., with or without storm cuffs, all have new collar and flap. We guarantee every jacket, price 15s.; extra heavy at 18s. 6d.; send lengths desired and chest measure. Overalls to match at 7s. 6d. and 8s. 6d. We pay carriage.—G. Raws and Sons, Indianrubber Manufacturers, The Albany, Oldhall Street, Liverpool.

The Motor Cycle T.T. Race.

THE appeal for donations for the prize fund in connection with the above competition has, we regret to say, met with little response. As we pointed out a fortnight ago, the expenses in connection with the race are very great, and with the object of somewhat lightening the burden on the A.C.U. and offering some substantial reward to the entrants it is necessary to raise a certain sum of money. Several members of the Competitions Committee think that a Shilling Fund will assist the A.C.U. in providing some cash prizes. Every motor cyclist can afford a shilling, and it is not unreasonable to expect that a large number will respond to this appeal. It is such a rare occurrence for motor cycles to be allowed legally to be driven all out over a hilly and arduous course on a certain allowance of petrol, and the benefits which are certain to accrue therefrom both to the industry and the pastime are so great, that a hearty response to this moderate appeal should be made. The secretary will therefore be glad to receive the shillings of those of our readers who may feel disposed to send them. Those who are generously inclined should forward twelve stamps or a postal order for one shilling to the Secretary of the A.C.U., 18, Down Street, Piccadilly, W.

A few enthusiastic motor cyclists to whom the Fund was mentioned at a committee meeting of the A.C.U. have already subscribed their shillings. Their names are: Messrs. W. H. Wells, H. G. Cove, A. G. Reynolds, F. Hardy, V. Hart, F. Straight, W. Pratt, and J. W. Brooker. To swell the Fund, we have sent one hundred shillings to the A.C.U. in addition to the small donation we have already given to the General Prize Fund.

Two-stroke Engines.

READERS will have noticed that the question of two-stroke or two-cycle engines used in competitions such as hill-climbs where the best performance is based on a formula has been exercising the minds of some competitors in recent events. The two-stroke engine differs from the ordinary type of internal combustion engine inasmuch as a charge of gas is drawn into the cylinder each time the piston descends, with the result that an explosion occurs at every revolution of the crankshaft instead of once every two revolutions.

The formula used for motor cycle hill-climbs is the $C \times T$ A.C.U., or Professor Callender's formula, $\frac{C \times T}{W}$, C being the cubical capacity in centimetres, T the time in seconds, and W the total weight of rider and machine.

Now, the question which has arisen is, should the cubical capacity of the two-stroke engine be given a fictitious figure to compensate for the additional working strokes of the engine, or should it be allowed to compete with ordinary engines on the same formula?

While this subject is under discussion, it is interesting to note that the Marine Motor Association of America, where a number of two-stroke engines are employed, uses the following formula, $\frac{A \times S \times N}{600}$,

A being area, S stroke, and N number of revolutions per minute, to arrive at the handicap. In the case of a two-cycle engine, the figure 400 is used as the divisor in place of 600. This handicaps the two-cycle engine to the extent of fifty per cent.

On a question of efficiency or arriving at the most powerful engine for a given cubical capacity, a handicap of this kind is obviously unfair. From a sporting point of view, the two-stroke, as shown by recent events, should certainly be handicapped in some form, but as motor competitions are held quite as much to prove engine efficiency and to improve the breed as to provide sport, is it fair to the designer and experimentalist who does succeed in making some improvement to debar him from the well-earned publicity? Failing some definite regulation on the subject from the ruling body, "we are as we were."

"The Autocar" Lectures.

AN announcement was made last week regarding the arrangements for holding *The Autocar* Lectures, reference to which has already been made in these columns. In all probability the lectures will be given in the following centres on the days named: Newcastle-on-Tyne, Monday; London, Tuesday; Cardiff, Wednesday; Leeds, Thursday; Manchester, Friday. The initial addresses will be delivered in each place during the last fortnight in October, and the series of eight lectures

will then be continued weekly until completion. In London an afternoon lecture will be given. The lectures, although intended primarily for motor car owners and drivers, will be just as interesting to motor cyclists. Dr. Ormandy and Mr. J. H. Lester will explain such subjects as carburation, ignition, cooling, etc., in simple non-technical language. For the London series, *The Autocar* has engaged the small hall of the Queen's Hall, Langham Place, W., for the afternoon lectures at 3.30 to 5 o'clock, and evening lectures 8.30 to 10 o'clock, on Tuesday, October 13th, and the seven succeeding Tuesdays. Readers should make a note of these dates and particulars, and we invite them also to assist in making the scheme known to their friends. *The Autocar* has instituted the series of lectures with a view not only of benefiting the movement generally, but partly to counteract the harmful influence of hysterical writers in the lay press, who have already done a great deal of injury to an important industry without the slightest thought for the large numbers of workers who are interested in it, their only object being to fill the columns of their papers with sensational copy. Motor cyclists who are interested in the matter of these lectures should write to the Secretary, Lecture Department, 20, Tudor Street, E.C.

A CURIOUS ACCIDENT.

ALTHOUGH the somewhat peculiar accident which is described in the following lines is liable to happen to any motor cyclist, readers need not immediately jump to the conclusion that tyres are bursting every day, or that when they do burst the machine will perform gyrations such as are described by a correspondent—Mr. L. Milsom, of Audley Lodge, Bath. With ordinary care and frequent attention to the tyre covers, it is possible to avoid a burst unless one happens to run the wheel over a sharp piece of glass or other puncturing material, which will cut through a cover and air tube, however carefully it may be tended by the rider.

Mr. Milsom says that while turning a corner the back tyre burst (probably it was slightly deflated and the cover blew off the rim), the machine swerved, and dashed straight into the brick-built pillar shown in the illustration. In some way the machine ran up the pillar and knocked off the heavy coping-stone shown in the photograph, cracking the pillar from top to bottom. Fortunately,

the rider was separated from the machine during these manoeuvres on the part of the motor bicycle; he was thrown clear, and escaped with a bruised head and knee. The motor bicycle, strange to say, only had the

The damaged brick wall and the machine that caused the damage.

front wheel slightly buckled, the handle-bars bent, and the left footrest bent back on to the engine pulley. The lamp and engine were unharmed, even the lamp-glass remaining unbroken, as will be seen from the illustration above.

Some useful terminals for high-tension magneto cables have been sent us by Messrs. Chater Lea, Ltd., Golden Lane, E.C. The special features claimed for these terminals are that they will not come off the ball on the magneto machine, no matter at what angle they are placed. It is recommended that the cable should be large enough in diameter to be pushed over the round end of the terminal to prevent any chance of short circuiting.

We would remind owners of tricars fitted with clutches of the ordinary cone leather-covered type that it is possible to stop these clutches from slipping by inserting some cork inserts which are supplied by the British American Co., 300 to 330, Widdrington Road, Coventry. Users of leather clutches addicted to slipping would do well to communicate with the company as above. Mr. M. W. Randle has used cork inserts on his Lagonda with every satisfaction.

COMPETITORS IN THE MOTOR CYCLE TOURIST TROPHY RACE.

(1) Noel E. Drury (5 h.p. Jap, accumulator ignition).
(4) R. M. White (6 h.p. Bat, accumulator).

(2) W. F. Newsome (3½ h.p. Triumph, magneto).
(5) F. Applebee (5 h.p. Rex, magneto).

(3) J. H. Slaughter (3½ h.p. Triumph, magneto).
(6) W. H. Wells (5 h.p. Vindec, magneto).

My Record Ride

By Arthur W. Bentley.

(Continued from page 680.)

Although it was 2 a.m. and bitterly cold, I passed many a cheering group by the roadside, and at Wick quite a large number of well-wishers had stayed out of their warm beds in order to wish me good speed.

My machine was now travelling at a great pace, and I began to have some doubt as to whether it could stand the pressure for the whole journey; but the further I went the more did it appear to revel in its task, so I did not slacken the pace for a moment, and was quickly running ahead of schedule time.

A Narrow Escape on Berriedale.

After surmounting Berriedale I started upon that most dangerous and precipitous descent on the south side of this hill, and thus early in the proceedings very nearly extinguished my chances of finishing the run, as I almost took a header over the precipice into the sea; but, thanks to two very powerful brakes, I managed to scramble round in safety, and in a few minutes was running through Brora.

Here a very sporting amateur, whose name I do not know, had stayed up the whole night in order to ride with me, but, unfortunately, his machine, which was only a 3 h.p., could not keep the pace, and again I had no companion.

The road is comparatively easy to follow, although there are several places where one might take the wrong turning, but I was fortunate in the possession of very explicit printed instructions which Mr. B. H. Davies had kindly lent me, and by occasionally referring to these as I rode along I managed to find my way without any difficulty.

The early morning was very cold, and occasionally I ran into a smart shower of rain; but at about 3.30 things cleared up, and by the time I reached Alness (115) the sun was shining brightly, and everything was crisp and fresh.

Outside Alness I ran over a poor little rabbit which darted out suddenly and ran under my wheel. After Dingwall I had only some ten miles to cover before reaching Beaulieu (134)—the end of the first stage of the journey.

Companions on the Second Stage.

Here Mr. Lomax and my brother Horace had arranged to meet me, and I lustily sounded the horn as I ran into this quiet little village to attract their attention.

Even before I had pulled up outside the hotel they were out in the road ready for me, and, leaving my machine in their hands to fill with petrol, I hurried indoors, where a steaming hot breakfast was already laid.

After covering 134 miles close to the sea shore in the early hours of the morning, it is surprising how very hungry one feels, and I was very glad to have ten minutes clear in which to devour a somewhat hasty but none the less pleasant early breakfast. Within ten minutes, however, all was ready for a restart, and the three of us

were soon making tracks for Inverness.

A short distance outside this town we were delayed for the first time by a puncture, a large nail having penetrated the back cover, but, hastily slipping in a spare detachable tube, we continued our way; but within five miles we picked up two more villainous-looking nails, which necessitated another stoppage, and my last spare tube was requisitioned. I did not like the idea of tackling the Grampians with no spare tubes, as mending a puncture takes about double the time that replacing a detachable tube does.

Luckily for me Mr. Lomax had three detachable Rogers tubes, and, strapping these on to my tank, we were once more in full swing.

Passing over Muirtown Bridge, we soon swung round to the right into the Perth Road, and were traversing the first strip of that track which is erroneously called "the road over the Grampians."

After covering about ten miles I glanced round to see how my brother was going, and was somewhat surprised to see that he was nowhere in sight, and, suspecting that he was the victim of another puncture, I proceeded on my way without troubling further about him.

It appears, however, that in rounding an awkward turning he collided with a bridge, and was thrown heavily, but after a time betook himself to the nearest house, where he was most kindly received, and where he slept for the next three hours.

The Road over the Grampians.

A few miles further on Mr. Lomax broke his belt, and was thus put out of the running, so I completed the remainder of the ride over the Grampians alone. The roads were very greasy, and, to make matters worse, in very bad condition. Frequently I came across large patches of loose stones, but managed to hold up all right, and after covering about forty miles gradually emerged on to a considerably better surface, which

My Record Ride.—

improved very perceptibly as mile after mile was traversed.

Running through Aviemore, Kingussie, and Dalwhinnie (208½), I had now passed the wildest part of the Grampians, and began to run through more populated regions.

To this point I think I can truthfully say that the only people I had met on the road were a couple of crofters and a group of school children, so that nobody, not even the police, can possibly accuse me of having driven to the danger of the public!

At Blair Athol there was a heavy shower of rain, but in ten minutes it had all cleared away, and the clouds began to rapidly disperse.

On the whole, the weather was all that could reasonably be desired, although, as previously mentioned, the Grampians had not recovered from the previous Sunday's downpour.

Exciting Experiences.

One of the great disadvantages of running at high speeds over this road, apart from the execrable surface, is the crossing of the bridges spanning the little burns that run down the mountain sides. They are so sharp that over some of them the machine was shot clear of the road, coming down with a crash that threatened to shake every bolt and nut loose, and it says much for my machine that it stood the fearful buffeting without a murmur and without a single particle suffering thereby. Speeding along without anything of interest happening except a short sharp race with a sporting hare, I passed Pitlochry and Dunkeld (251), and, opening the throttle a little wider, ran into the bonny city of Perth two precious hours ahead of time, having traversed the 266½ miles in very good time, considering all things. I was within my time-table, and that was comforting.

Leaving my machine in the hands of Mr. Pople, who was meeting me here after winning a gold medal in the London to Edinburgh run, I enjoyed a most sensible meal.

The inhabitants of Perth seemed to scent something in the wind, and just as I came out of the hotel somebody out of the small crowd that had gathered round my machine presented me with the best apple I have tasted for many a long day.

During the night time later in the ride, when I was very faint from want of food, this apple was remembered, and made just all the difference to me.

A Glorious Run after Perth.

Within ten minutes we were off once more, and with Mr. Pople acting as pilot, we were soon out of Perth, and leaving the granite sets and tramlines behind, were running through that glorious stretch of country that lies between Perth and Auchterarder. Although it is quite true that one does not really appreciate the scenery in a run like this, it is none the less true that your spirits considerably rise when you are passing through beautiful country, and correspondingly fall when you are traversing some of the dirty grimy country along this route.

As Mr. Pople was mounted upon a first class machine, we travelled at a very good pace, but, of course, took matters somewhat quietly through the numerous villages and towns. What a pity some children look upon the road as their natural and exclusive playground, and consider the best sport imaginable is to run in front of your machine, sending cold shudders down your backbone and causing your fingers and foot to hover nervously in the vicinity of your brakes. Except for these anxious moments how much safer and pleasanter motoring would be.

The sun had now made its appearance in real earnest, and after we had passed through Stirling (301), the heat became somewhat oppressive, clad as I was in waterproof clothing.

Through Denny, Cumbernauld, Newhouse, and Newmains we sped without a hindrance, and in a short time turned into that splendid stretch of road leading to Lockerbie, along which it is possible to ride at any speed without the least danger.

Passing through Crawford Inn and Beattock Bridge (373), we had got within a few miles of Lockerbie when my machine suddenly ceased firing, and for the first

The acute corner at the foot of Berriedale which required negotiating very carefully. The wall on the roadside can be seen doubling back upon itself.

time something was amiss with the engine. We found the exhaust valve was broken, so we slipped a spare valve in, and, notwithstanding this delay, ran into Lockerbie two and a half hours ahead of schedule. Outside the King's Arms Hotel it appeared to us that practically the whole population of Lockerbie had gathered, and it was with some difficulty that we managed to make our way into the dining room, leaving my machine outside to be filled up by another amateur motor cyclist (whose name unfortunately I do not know) who had consented to pilot me down to Wigan.

The food at Lockerbie was rather too heavy to be palatable, and as I knew that food would be ready for me at Wigan, and that I should have a sit down meal at Whitchurch (the only one I had scheduled), I did not worry, and proceeded after eating several bananas and drinking several cups of coffee. The next stage was to Wigan (132 miles). If only I had realised how

My Record Ride.—

my arrangements were to fall through, that heavy meat pie would have somehow or other found its way whole into my pocket!

Saying good-bye to Mr. Pople, I made my way carefully through the crowd, and once clear of the town was out on the road to Ecclefechan, which was soon left behind, and in a few minutes entered upon the last few miles of the journey through dear bonnie auld Scotland.

Through Gretna Green and with a final farewell roar I was over Sark Bridge and across the border and entering upon the long run through England.

Slowing down through Carlisle, I came upon that fast stretch of road beyond, and hopping along in fine style, ran through Penrith out on to the twenty-six miles run over Shap into Kendal.

In the Best of Spirits.

The evening was beautifully fine, my machine, as usual, was pulling splendidly, and I was feeling gorgeously fit, though a trifle hungry, and to add to it all I was over two hours ahead of schedule, and consequently in the best of spirits, and I can never

On the Grampians. Two motor cyclists waiting to accompany me on part of the ride.

remember having felt happier and more contented with the world in general than I did as I romped up the long hill on to the top of Shap and away down the other side.

About half-way down the south side of this hill I crossed over the half-way mark of my ride, thoroughly satisfied with this first portion, and devoutly praying that the next 450 miles would prove as satisfactory as the first stretch had been.

Shortly after passing Kendal I received warning of a police trap, and as these warnings were renewed at short intervals all the way into Lancaster, I bestowed benediction on the police, and reluctantly throttled down to a ridiculously low speed considering the open state of the road.

Five minutes in Lancaster for a mug of warm soup and a couple of bananas to fortify me, and I commenced the eighty-four miles run into Whitchurch, where I knew a good sit-down dinner would be awaiting me.

Daylight was now fast failing, so I made the most of it and kept up a good pace through Garstang and Preston, and in a few minutes had pulled up in Wigan to light lamps before starting on the last forty-four miles to Whitchurch.

I had up to now only partaken of what might be termed very light refreshment, such as eggs, bananas, and milk, at Beaulieu, Perth, and Lockerbie, and by now the pangs of hunger were making their presence felt in no uncertain manner. Moreover, I began to feel very tired, and looked forward with much satisfaction to my one and only sit-down meal which I knew must even now be in course of preparation, and as I bowled along I cheered myself by the thought of the tempting dishes that would be spread for me, and which would put new life into my famished body.

Through Warrington and Tarporley I sped, and now upon the last fourteen miles. How long they seemed; it appeared to me that ages had elapsed ere I discerned the lights of Whitchurch twinkling in the distance, looking like so many little beacons guiding me on to my much-needed rest and refreshment.

Whitchurch at last! Sounding the horn loudly as I ran into the town shortly after midnight, three hours ahead of time, I rode up to the door of the hotel with a great sigh of satisfaction.

What did it mean that there were no lights in the hotel? I was rather disappointed to find nobody there to greet me, no hands to take my machine from me, and no apparent preparation for my arrival; but thinking that they had not heard me arrive, I again sounded my horn, and as this produced no result I dismounted and beat vigorously upon the door of the hotel. Absolute dead silence reigned for some minutes, but at last I heard steps inside, and with much fumbling of locks and bolts the door was half opened, and a voice asked me what I was wanting!

An Awkward Fix.

On stating the nature of my wants, and asking whether my pilot was ready for me, I was informed that neither was a meal ready, nor was there anybody in Whitchurch expecting my arrival. The door closed, and I sat down to think what my best plan would be.

For some inexplicable reason my plans had fallen down at the most important place of the whole run—in fact, at the most critical stage of the whole affair—and for a few minutes I sat there, too absolutely miserable and wretched to know what to do.

Here was I at 12.30 on a pitch dark night, literally ill from want of food. A light rain was falling. I was totally ignorant of the road, and, to add to my misery, my lamps would scarcely keep alight at all.

At that moment I would have given everything I possess in this world (not much, it is true) for, firstly, a meal and, secondly, a real good pilot, but as both were out of the question, I slowly rose to my feet, and with a sinking heart started my trusty little friend off out of the town, and in under two minutes we were enveloped in the inky blackness of the night, which my two lamps did little to brighten.

Creeping slowly along the dark lanes and stopping frequently in order to read the signboards, I made my way laboriously along for some twenty miles or so, when I began to have a very strong presentiment that I had left the right road, and that I was now in some unknown region.

To make matters worse, one lamp struck work altogether, and the other seemed as if it intended to follow suit very shortly, and as no amount of coaxing made the least difference to either of them, I continued my ride more or less in complete darkness.

(To be continued.)

OCCASIONAL COMMENTS.

By "IXION."

Audible Warnings.

In the course of my motor cycling experience I must have tried practically every form of road clearer ever invented, even including those diabolical echo-wakers which are worked by the exhaust. The most effective in a gentlemanly way that I have tried is the little "develine" whistle, or mouth syren. A mouth whistle is not particularly convenient for solo use, but it is ideal for passenger work, as it can lie on the passenger's lap till need arises for its use. I do not pretend that it is audible either to a drowsy carter or a driver of a rattling mineral water cart, but it is a sure means of giving notice of one's approach to most drivers of vehicles in time for the overtaken one to draw aside without compelling you to declutch, switch off, or change gear. No driver of a passenger motor cycle should be without one. Drivers of solo machines should eschew the deep booming type of hooter, and use a horn possessing a note that is high without being thin—no easy combination to discover.

Petrol Levels.
